APPLIED ENGINEERING IS 100% APPLE

That's Why We're So Good At It!

THE NEW TIMEMASTER II

Automatically date stamps files with PRO-DOS

NEW 1984 DESIGN
An official PRO-DOS Clock

- Just plug it in and your programs can read the year, month, date, day, and time to 1 millisecond! The only clock with both year and ms.
 - A rechargeable NiCad battery will keep the TIMEMASTER II running for over ten years.
 - Powerful 2K ROM driver — No clock could be easier to use.
 - Full emulation of most other clocks, including Thunderclock and Appleclock (but you'll like the TIMEMASTER II mode better). We emulate other clocks by merely dropping off features. We can emulate them but they can't emulate us.
 - Basic, Machine Code, CP/M and Pascal software on 2 disks!
 - Eight software controlled interrupts so you can execute two programs at the same time (many examples are included).
 - On-board timer lets you time any interval up to 48 days long down to the nearest millisecond.
- The TIMEMASTER II includes 2 disks with some really fantastic time oriented programs (over 40) including appointment book so you'll never forget to do anything again. Enter your appointments up to a year in advance then forget them. Appointment book will remind you in plenty of time. Plus DOS dater so it will automatically add the date when disk files are created or modified. The disk is over a \$200.00 value along—we give the software others sell. All software packages for business, data base management and communications are made to read the TIMEMASTER II. If you want the most powerful and the easiest to use clock for your Apple, you want a TIMEMASTER II.

PRICE \$129.00

Super Music Synthesizer Improved Hardware and Software

- Complete 16 voice music synthesizer on one card. Just plug it into your Apple, connect the audio cable (supplied) to your stereo, boot the disk supplied and you are ready to input and play songs.
- It's easy to program music with our compose software. You will start right away at inputting your favorite songs. The Hi-Res screen shows what you have entered in standard sheet music format.
- Now with new improved software for the easiest and the fastest music input system available anywhere.
- We give you lots of software. In addition to Compose and Play programs, 2 disks are filled with over 30 songs ready to play.
- Easy to program in Basic to generate complex sound effects. Now your games can have explosions, phaser zaps, train whistles, death cries. You name it, this card can do it.
- Four white noise generators which are great for sound effects.
- Plays music in true stereo as well as true discrete quadrasonic.
- Full control of attack, volume, decay, sustain and release.
- Will play songs written for ALF synthesizer (ALF software will not take advantage of all our card's features. Their software sounds the same in our synthesizer.)
- Our card will play notes from 30HZ to beyond human hearing.
- Automatic shutoff on power-up or if reset is pushed.
- Many many more features.

PRICE \$159.00

Z-80 PLUS!

- TOTALLY compatible with ALL CP/M software.
- The only Z-80 card with a special 2K "CP/M detector" chip.
- Fully compatible with microsoft disks (no pre-boot required).
- Specifically designed for high speed operation in the Apple IIe (runs just as fast in the II+ and Franklin).
- Runs WORD STAR, dBASE II, COBOL-80, FORTRAN-80, PEACHTREE and ALL other CP/M software with no pre-boot.
- A semi-custom I.C. and a low parts count allows the Z-80 Plus to fly thru CP/M programs at a very low power level. (We use the Z-80A at fast 4MHZ)
- Does EVERYTHING the other Z-80 boards do, plus Z-80 interrupts.

Don't confuse the Z-80 Plus with crude copies of the microsoft card. The Z-80 Plus employs a much more sophisticated and reliable design. With the Z-80 Plus you can access the largest body of software in existence. Two computers in one and the advantages of both, all at an unbelievably low price.

PRICE \$139.00

Viewmaster 80

There used to be about a dozen 80 column cards for the Apple, now there's only ONE.

- TOTALLY Videx Compatible.
- 80 characters by 24 lines, with a sharp 7x9 dot matrix.
- On-board 40/80 soft video switch with manual 40 column override
- Fully compatible with ALL Apple languages and software—there are NO exceptions.
- Low power consumption through the use of CMOS devices.
- All connections are made with standard video connectors.
- Both upper and lower case characters are standard.
- All new design (using a new Microprocessor based C.R.T. controller) for a beautiful razor sharp display.
- The VIEWMASTER incorporates all the features of all other 80 column cards, plus many new improvements.

	PRICE	BUILT-IN ADJUSTSWITCH	SHIFT KEY SUPPORT	LOW POWER DESIGN	80 COLUMN HARDWARE	7x9 DOT MATRIX	LIGHT PEN INPUTS	40 COLUMN OVERRIDE	INVERSE CHARACTER
VIEWMASTER	169	YES	YES	YES	YES	YES	YES	YES	YES

The VIEWMASTER 80 works with all 80 column applications including CP/M, Pascal, WordStar, Format II, Easywriter, Apple Writer II, VisiCalc, and all others. The VIEWMASTER 80 is THE MOST compatible 80 column card you can buy at ANY price!

PRICE \$179.00

- Expands your Apple IIe to 192K memory.
- Provides an 80 column text display.
- Compatible with all Apple IIe 80 column and extended 80 column card software (same physical size as Apple's 64K card).
- Can be used as a solid state disk drive to make your programs run up to 20 times FASTER (the 64K configuration will act as half a drive).
- Permits your IIe to use the new double high resolution graphics.
- Automatically expands VisiCalc to 95 K storage in 80 columns! The 64K config. is all that's needed, 128K can take you even higher.
- PRO-DOS will use the MemoryMaster IIe as a high speed disk drive.

MemoryMaster IIe 128K RAM Card

- Precision software disk emulation for Basic, Pascal and CP/M is available at a very low cost. NOT copy protected.
 - Documentation included, we show you how to use all 192K.
- If you already have Apple's 64K card, just order the MEMORYMASTER IIe with 64K and use the 64K from your old board to give you a full 128K. (The board is fully socketed so you simply plug in more chips.)

MemoryMaster IIe with 128K **\$249**
Upgradeable MemoryMaster IIe with 64K **\$169**
Non-Upgradeable MemoryMaster IIe with 64K **\$149**

Our boards are far superior to most of the consumer electronics made today. All I.C.'s are in high quality sockets with mil-spec. components used throughout. P.C. boards are glass-epoxy with gold contacts. Made in America to be the best in the world. All products work in the APPLE IIe, II+, II+ and Franklin. The MemoryMaster IIe is IIe only. Applied Engineering also manufactures a full line of data acquisition and control products for the Apple; A/D converters and digital I/O cards, etc. Please call for more information. All our products are fully tested with complete documentation and available for immediate delivery. All products are guaranteed with a no hassle **THREE YEAR WARRANTY.**

* Most Public Domain Software supplied by the Computer Learning Center has no copyright attached and may be copied and distributed by anyone without regard for origin or ownership. Public Domain Software is not commercial quality, and is supplied as-is.

Many of the articles published in Hardcore COMPUTIST detail the removal of copy protection schemes from commercial disks or contain information on copy protection and backup methods in general. We also print bit copy parameters, tips for adventure games, advanced playing techniques (APT's) for arcade game fanatics and any other information which may be of use to the serious Apple user.

Hardcore COMPUTIST also contains a center CORE section which generally focuses on information not directly related to copy-protection. Topics may include, but are not limited to, tutorials, hardware/software product reviews and application and utility programs.

What Is a Softkey Anyway? A softkey is a term which we coined to describe a procedure that removes, or at least circumvents, any copy protection that may be present on a disk. Once a softkey procedure has been performed, the disk can usually be duplicated by the use of Apple's COPYA program which is on the DOS 3.3 System Master Disk.

Following A Softkey Procedure: The majority of the articles in Hardcore COMPUTIST which contain a softkey will also include a discussion of the type of copy protection present on the disk in question and the technique(s) necessary to remove that protection. Near the end of the article, a step-by-step "cookbook" method of duplicating the disk will appear. Generally, the appropriate actions for the reader to perform will appear in boldface type. Examples are:

1) Boot the disk in slot 6

PR#6

or

2) Enter the monitor

CALL -151

It is assumed that the reader has some familiarity with his or her Apple, i.e. knowing that the RETURN key must be hit following the commands illustrated above.

Hardcore COMPUTIST tries to verify the softkeys which are published, although occasionally this is not possible. Readers should be aware that different, original copies of the same program will not always contain an identical protection method. For this reason, a softkey may not work on the copy of a disk that you own, but it may work on a different copy of the same program. An example of this is Zaxxon, by Datasoft, where there are at least 3 different protection methods used on various releases of the game.

Requirements: Most of the programs and softkeys which appear in Hardcore COMPUTIST require an Apple II+ computer (or compatible) with a minimum 48K of RAM and at least one disk drive with DOS 3.3. Occasionally, some programs and procedures have special requirements such as a sector editing program or a "nonautostart" F8 monitor ROM. The prerequisites for deprotection techniques or programs will always be listed at the beginning article under the "Requirements:" heading.

Software Recommendations: Although not absolutely necessary, the following categories of utilities are recommended for our readers who wish to obtain the most benefit from our articles:

- 1) **Applesoft Program Editor** such as Global Program Line Editor (GPLE).
- 2) **Disk Editor** such as DiskEdit, ZAP from Bag of Tricks or Tricky Dick from The CIA.
- 3) **Disk Search Utility** such as The Inspector, or The Tracer from The CIA.
- 4) **Assembler** such as the S-C Macro Assembler or Big Mac.
- 5) **Bit Copy Program** such as COPY II+, Locksmith or The Essential Data Duplicator.
- 6) **Text Editor** capable of producing normal sequential text files such as Applewriter II, Magic Window II or Screenwriter II.

Three programs on the DOS 3.3 System Master Disk, COPYA, FID and MUFFIN, also come in very handy from time to time.

Hardware Recommendations: Certain softkey procedures require that the computer have some means of entering the Apple's system monitor during the execution of a copy-protected program. For Apple II+ owners there are three basic ways this can be achieved:

1) Place an INTEGER BASIC ROM card in one of the Apple's slots.

2) Install an old monitor or modified F8 ROM on the Apple's motherboard. The installation of a modified F8 ROM is discussed in Ernie Young's, "Modified ROMS", which appeared in Hardcore COMPUTIST No.6.

3) Have available a non-maskable interrupt (NMI) card such as Replay or Wildcard.

Longtime readers of Hardcore COMPUTIST will vouch for the fact that the ability to RESET into the monitor at will, greatly enhances the capacity of the Apple owner to remove copy protection from protected disks.

A 16K or larger RAM card is also recommended for Apple II or II+ owners. A second disk drive is handy, but is not usually required for most programs and softkeys.

Recommended Literature: The Apple II and II+'s come bundled with an Apple Reference Manual, however this book is not included with the purchase of an Apple II/e. This book is necessary reference material for the serious computist. A DOS 3.3 manual is also recommended.

Other helpful books include:

Beneath Apple DOS, Don Worth and Peter Leichner, Quality Software, \$19.95.

Assembly Lines: The Book, Roger Wagner, Softtalk Books, \$19.95.

What's Where In The Apple, William Lubert, Micro Ink, \$24.95.

Typing In BASIC Programs: When typing in basic programs, you will often encounter a delta ("♦") character. These are the spaces you MUST type in if you wish your checksums to match ours. All other spaces are merely printed for easier reading and don't have to be keyed in. Any spaces after the word DATA that aren't delta characters MUST be omitted!

It is a good idea to SAVE your BASIC program to disk frequently while typing it in to minimize the loss of data in the event of a power failure.

Checksoft: Checksoft is a Binary program that checks Applesoft programs to ensure that you have keyed them in properly. Every bin program we print has companion checksums which consist of the Applesoft program's line numbers and a hexadecimal (base 16) number for each line. After keying in a BASIC program, BRUN checksoft and compare the checksums for every line that Checksoft generates with those at the end of the program. If you use Checksoft and make a typing error, your checksums will differ from ours beginning at the line where you made the error.

Typing In Binary Programs: Binary programs are printed in two different formats, as source code and as object code in a hexadecimal dump. If you want to type in the source code, you will need an assembler. The S-C Macro Assembler is used to generate all the source code which we print. In our source code listings, the memory address of the each instruction is printed at the beginning of every line (instead of the line number).

Binary programs can also be entered directly with the use of the Apple monitor by typing in the bytes listed in the hexdump at the appropriate addresses. Be sure to enter the monitor with a CALL -151 before entering the hexdump. Don't type the checksums printed at the end of each line of the hexdump and don't forget to BSAVE binary programs with the proper address and length parameters listed in the article.

Checkbin: Like Checksoft, Checkbin also generates checksums, but was designed to check binary (machine language) programs.

Whenever Hardcore COMPUTIST prints a hexdump to type in, the associated Checkbin generated checksums are printed after every 8 bytes and at the end of every line.

Checksoft and Checkbin were printed in Hardcore COMPUTIST No. 1 and the Best Of Hardcore Computing and are sold on Program Library Disk No. 1 and the Best Of Hardcore Library Disk.

Let Us Hear Your Likes And Gripes: New and longtime readers of Hardcore COMPUTIST are encouraged to let us know what they like and don't like about our magazine by writing letters to our INPUT column. Our staff will also try to answer questions submitted to the INPUT column, although we cannot guarantee a response due to the small size of our staff. Also, send your votes for the softkeys you would like to see printed to our "Most Wanted List."

How-To's Of Hardcore

Welcome to Hardcore COMPUTIST, a publication devoted to the serious user of Apple II and Apple II compatible computers. We believe our magazine contains information you are not likely to find in any of the other major journals dedicated to the Apple market.

Our editorial policy is that we do NOT condone software piracy, but we do believe that honest users are entitled to back up commercial disks they have purchased. In addition to the security of a backup disk, the removal of copy protection gives the user the option of modifying application programs to meet his or her needs.

New readers are advised to read over the rest of this page carefully in order to avoid frustration when following the softkeys or typing in the programs printed in this issue. Longtime readers should know what to do next: Make a pot of coffee, get out some blank disks and settle in for a long evening at the keyboard.

Alpha And Omega

I would like to ask if you have any knowledge of Omega's bankruptcy and whether or not Alpha Logic Business Systems is planning on honoring subscriptions and disk orders that I sent to Omega.

In December, I ordered Locksmith 5.0 and Night Falls; in June I received Locksmith 5.0 (and I would have to say that I have yet to be able to copy anything at all with it: it is hopeless), but have not as yet received Night Falls. As I had prepaid, I am a little upset by this. I also ordered (and prepaid) for a disk with their parameter list as well as a subscription to the Newsletter. To date, some four months later, I have heard nothing.

Fortunately, I also have EDD III. This is currently my favourite copy program next to COPYB and Super DeMuffin Plus.

Also, a quick softkey routine which I have just used on **Transylvania**, **Minit Man** and **Arcade Boot Camp** (which are all great games):

- 1) Boot Disk
- 2) Reset into monitor via Integer Card

B925:18 60
B988:18 60
B942:18 60

- 3) BLOAD FID or COPYA

CALL -151
B954:4A 49 6A D0 EF
B934:C9 DA
B990:C9 DA
803G

(starts FID or COPYA)

- 4) Copy files to blank disk (COPYA will also format the disk. FID will not.)

- 5) Overwrite DOS with Fast DOS or Diversi-DOS

Minit Man needs changes to HELLO program and others as outlined in an earlier magazine. Arcade Boot Camp runs without changes, but Transylvania may need minor changes.

Another quick one:

For **Kabul Spy**:

Use Locksmith 4.1 to copy T0-21. Then use a sector editor to load T0 Sector 0 and change bytes 49,4A and 4B to EA's. This defeats the check routine on T22.

I would also like to know if anybody has copied Fortress of the Witch King from Avalon Hill. I have been able to get a Catalog (it uses a non-standard DOS) but cannot transfer any files.

Keep up the good work!

Dr. Leigh Rowan-Kelly
North Hobart, Tasmania
Australia

Dr. Rowan-Kelly: We have spoken to the folks at Alpha Logic concerning what you, and other people who placed orders with Omega but never received delivery, should do. They suggest you send whatever information you have concerning the order (name and address, Locksmith serial #, order date, products ordered, date the check cleared, etc.) to them at:

*Alpha Logic Business Systems
4119 North Union Road
Woodstock, IL 60098*

When Alpha Logic took over from Omega, the correspondence was apparently in considerable disarray, so Alpha Logic may or may not have a record of your order. Alpha Logic did not directly receive any funds as a result of Omega's bankruptcy, but in order to maintain good relations with its customers, they are trying to honor all orders which were placed with Omega for Locksmith and its related products (Inspector, Watson and the Locksmith Newsletter). The rights for some of Omega's products, such as the game Night Falls, were not acquired by Alpha Logic and it is not clear how they will handle an order such as the one you placed. In any case, supply Alpha Logic with whatever information you can.

Many thanks for your softkeys and parameters.

Stung By Stoneware

Re Paul Raymer's letter in **Hardcore COMPUTIST No. 8.** — page 3

I would like to add to his comments by saying that support from Stoneware in this part of the world is NIL.

I have been involved in three upgrade orders from Stoneware and, in all cases, the order was lost. This has resulted in extra expense by way of telexes (which Stoneware refuses to answer) and telephone calls in which promises were made and not kept.

The upgrades have arrived eventually (at least four months after being ordered) and, in the latest case, an incorrect Customs declaration by Stoneware caused Customs to assess sales tax on the value plus 20%.

Another user I know has been having problems with the DIF file translator. She is responsible for keeping certain hospital records on DB MASTER. Not only has Stoneware refused to give her any help, but they have even held onto at least six disks which she has sent them. She has spent nearly \$100 on phone calls and telexes, to no avail.

This brings me to the point where I say that the software is good, but the service is lousy. Therefore, it is essential to have backups of the program disks.

The parameters for **DB Master Version 4** in **Hardcore COMPUTIST No. 10** did not

work on my copy. However, by using Locksmith 5.0 to copy tracks \$0 to \$6, \$6.5 to \$11.5, \$14.5 to \$22.5, and EDD (in mode 2) to copy tracks \$12.25 and \$13.25, I have succeeded in making working backups. EDD has to be used repeatedly on the two quarter tracks until no error message appears (usually about three goes per track). The quarter tracks appear to be crucial only on program disk No. 1.

DB Master Version 4 Plus, however, appears to use a different protection scheme and has so far resisted all attempts to make backups (as we are permitted under new Australian copyright laws). Therefore, I request that you put DB Master 4 Plus on your Most Wanted List.

Anthony L. Barnett
Prospect, Australia

Replay, SSI, DeMuffin, Etc

I think that your magazine is great! The information you have published in previous issues has proved very helpful to me, but a couple of problems have been irritating the heck out of me.

First, would you please add Prime Plotter (Primesoft Corporation) and Bookends (Sensible Software) to your Most Wanted List? Prime Plotter appears to have a very sophisticated and multi-layered protection scheme. Bookends is not as bad, but I haven't been able to copy it, either.

Second, my SSI disks won't boot; they just beep at me. SSI customer support claims that either my drive speed is off (it isn't) or I need an alignment job (I may). I solved this problem by copying the boot sequence with my Replay Card. Now I have a binary program called SSI BOOT on the back side of my SSI disks.

Do you know what happened to the automatic packing program promised to Replay owners by Micro-Analyst, Inc.? I haven't been able to get a response from their answering machine at (512) 926-4527.

Third, some softkeys tell you to reset into the monitor during or after the boot; however, many protected programs reboot if you hit reset. So, how is one to get into the monitor in such a case?

Fourth, a program called Super DeMuffin is floating around. Could you publish an article which lists the program and explains how to use it?

Finally, a couple of suggestions. How about a list of BB phone numbers for those of us with modems? And, could you publish a list of addresses and phone numbers of other useful sources of information? I am, for example, familiar with Pirate's Harbor, P.O. Box 8928, Boston, MA 02114; tele-

phone (617) 720-3600 for modem, password required.

Dr. James N. Snaden
Newington, CT

Dr. Snaden: Thanks for your suggestions. We will see what we can do.

Owners of the Replay card should have received notice that the packing program you mentioned is now available. Perhaps you are no longer on their mailing list. To get the program, call or write Micro-Analyst.

If you have an autostart F8 ROM, your Replay card can be used to get you into the monitor when following most of the softkeys we publish.

Lowercase Deadline

On my copy of Deadline (an old one), the locations for the Upper and Lower case output are different. The bytes at Track 2, Sector 9 are at \$E9-F3 on Sector 11. The byte at Track 2, Sector 7 is at \$3C, and I have not been able to find the location of the other byte. Can anybody help me?

Erik Talvola
Agoura Hills CA

Erik: Sorry, we can't be of any help to you here. We will have to turn this one over to our readers.

Locksmith 5.0 Patch

Re Roger M. Levin, INPUT, Issue No. 10.

The suggested single byte change on Track \$F, Sector \$E to render Locksmith 5.0 copyable works fine. The disk is thereafter completely copyable via COPYA. However, with a copy of my particular disk, neither the Disk Certification nor the Drive Speed functions are accompanied by a useful monitor display. Both of these work perfectly when I use my original. Can you elaborate on how to copy the disk so as to retain all of its functions within the copy? I sure would appreciate it.

Along other lines: I have nothing but the highest praise for the content of your publication. I wondered (along with everyone else, I suspect) why you underwent such confusing name and format changes early in your history and was apprehensive about losing such a valuable source of otherwise unavailable information. However, I am delighted that your magazine persists in ANY form. In my opinion, your publication is the best available for anyone seriously interested in Apple software - period. Please accept my wishes for your continued success and my personal thanks for the invaluable information I have gained through your efforts. No one else could do it any better.

Brian T. Halonen
Sturtevant WI

Brian: Here is a different sector edit, submitted by Mr. Dan Lui, that can be performed on a COPYA of Locksmith 5.0.

Track	Sector	Byte	From	To
\$10	\$05	\$18	\$38	\$F2
\$10	\$05	\$18	\$7D	\$F3
\$10	\$05	\$18	\$0A	\$F0

So far as we have been able to tell, a completely functional copy of Locksmith 5.0 will result.

Atarisoft Revisited

Requirements:

48K Apple II, II Plus, ///e
One disk drive
DOS 3.3

Dig Dug and Defender, like all Atarisoft games, can be copied as Robotron was in Hardcore COMPUTIST No. 8. But in copying a disk, if possible, I like to put the game into one file so it can be saved under the game's name on a program backup disk with many other games (instead of one game per disk).

In Dig Dug, three files are needed for the game to run. Here is how you'd make a single file of Dig Dug off the original disk:

- 1) Boot normal DOS 3.3.
- 2) Put the original in the disk drive.
- 3) Enter the monitor by typing

CALL -151

- 4) Change the error detection routine in DOS by typing

B942:18

- 5) BLOAD the three programs in the right place:

BLOAD RELOCATE,A8042

BLOAD TP,A8192

BLOAD OBJECT CODE

- 6) Put in the disk you wish to save the file on and type

BSAVE DIG DUG, A8042, L24726

- 7) Smile, you're done!

For Defender you can use steps 1-4 then

BLOAD BILL BOGENREIF 10/9

- 5) Put disk to save in drive and type

BSAVE DEFENDER,A16384,L16384

Trevor Churchill
Kindersley, Saskatchewan
Canada

Assorted Tips

For whatever it is worth, the following techniques work:

- 1) The softkey for Visiterm would not work on my version. However, it uses a bit insertion technique, so Copy II+ 4.4 from the main menu works nicely.

2) Some of the Stickybear series may be COPYAed. Then edit Track 2, Sector 6, byte 00:60 and Track 2, Sector 7 Byte 00:1F.

3) Snooper Troops 1 & 2 from Spinnaker succumb nicely to IOB. Track 9 burps a lot, but if you IOB the disk, then FID it over to normal DOS 3.3, everything works. Unfortunately, I think that it is the only Spinnaker disk with a normal VTOC.

4) The Krell SAT series works with DeMuffin, and also works loading and saving to tape. Using a cassette recorder is often overlooked, but it works for a lot of programs.

5) The Cracking Techniques '83 and '84 disks from Pirate's Harbor have a lot of good stuff on them, including some of the programs from the Most Wanted List.

6) Many older programs and educational programs from small companies can be COPYAed. It's so simple that it is worth a try before you spend a lot of time on it. Just perform the following sequence

RUN COPYA

CTRL C

70

CALL -151

B92F:18 60

B98B:18 60

RUN

kills data marks

If that doesn't work, repeat with

B925:18 60

B988:18 60

kills checksum

I do consulting work for several schools and part of what I do is make backups of new software before the kids get their little hands on it. Naturally, if I were voting, I would like to see more business and educational softkeys and less emphasis on games.

One final question: Do you have any knowledge of a nibble copier called Echo from Nagrant Systems? Almost everyone I know has a copy, yet nobody has ever seen an ad for it, heard of the company, or seen a manual to it. What gives?

Carl A. Meyer
Kettering OH

Mr. Meyer: We have been unable to find a reference to the Echo nibble copier you mention. Perhaps our readers can come up with some information for you.

Sensible Speller IV Entry Points

I would like to report that I have had success backing up Sensible Speller IV 4.0i and 4.0k using Lamont Cranston's method from Issue No. 10. However, for an entry point for the program(s), I used the second and third bytes found on track \$08, sector \$00. This gave me entry points of \$350F for 4.0k and \$3517 for 4.0i, which do not agree with those given in Issue No. 11. Interestingly enough, both the entry points you listed and the ones I used seem to work equally well. Maybe you can explain why. I can't. I still

suspect that all the versions may have their entry point located there (track \$8, sector \$0), even though other entry points will work.

Concerning the review of the Copy II Plus 4.4C copy program - the update manual also fails to mention that they give you the 4.4 program on the front side as well as the older 4.3 program on the back side. So far, I have found at least one disk that would not copy by the defaults on the 4.4. The parms listed for the 4.3 would not work either. The older 4.3 with the given parms would copy it, so having both is a definite advantage.

The parms given for Sensible Speller in Issue No. 11 (with the article about Copy II Plus) is probably for version 4.0k. It is a special version they will send to you if you have trouble with it booting. I have a Fourth Dimension drive that works fine for most disks, but it would not boot the 4.0i. The 4.0k would not only boot, but would copy in several ways (unlike the 4.0i and probably most of the others).

For those who have similar drives, I have noticed one other problem in that you can make a copy (in this case, RENDEZVOUS) which will not boot on the Fourth Dimension, even though the original will. However, the copy will boot on the Apple Disk II drive. There may be others, like me, who thought they were having no success when all they really needed to do was change the drives around. This could be a problem for some people in that the instructions with most copy programs to change the master vs. slave drives by software will not solve. Instead, a physical change of the plugs is necessary.

Gerald Gibson
Dallas TX

page 6

I have just received **Issue No. 10** with the article by "The Shadow" (Lamont Cranston) concerning **Sensible Speller IV**.

There was a typo in his article referring to entry storage at \$3E-3F. This should have read \$4E and \$4F.

Version 4.0h can be done as per article. Actual entry is \$34F9. Change line 1070 of assembly listing to \$34F9. Change hexdump to: B790: 4C F9 34.

G.L. Scott
Charlotte NC

page 6

I have **version 4.0j** of **Sensible Speller IV**. Following the program outlined in **Hardcore COMPUTIST Issue No. 10**, I was able to deprotect it. This required a change in the entry point. In the Boot 2 Object Code program, change B791 from 17 to 22. This gave me a COPYable Sensible Speller IV.

Apple II Owners Respond

In response to your note on **Page 5** of

Hardcore COMPUTIST No. 11, please let's not clutter Hardcore with IBM info or even Mac-stuff. The owners of those machines will certainly benefit from a "Hardcore-type" magazine, but let them find it between their own covers. I believe they also would appreciate the narrowness of focus that Apple II users realize with Hardcore COMPUTIST in its present form.

Another topic: Can you please furnish me with the address of Synergetics (mentioned in the INPUT column for HC No. 11)? I'm interested in the //e RESET mod.

Thanks for the great magazine!

Marvin L. Wager
San Diego CA

Mr. Wager: The address of Synergetics is: Synergetics

*Box 1300
Thatcher, AZ 85552
(602) 428-4073*

We forgot to mention that this RESET mod kit for the //e does require access to an EPROM burner.

The situation has presented itself, so I must act. I would not like to see Hardcore COMPUTIST begin aiming towards other computers, but to continue serving the Apple II series users.

Let me digress for a moment. Once I had subscriptions to Softalk, St. Game (originally Softline), Creative Computing, Call A.P.P.L.E., Nibble and Hardcore COMPUTING. I also had access to many other multi-brand magazines that at least had a section for Apple II's. As each magazine became relatively useless (considering the price to information ratio), I stopped reading them and as subscriptions waned, I let them drop. The last to go was Call A.P.P.L.E. It had lots of article/programs and great deals for Mac owners, double hi-res vision users and anyone who might want to drag a //c to school.

My Apple II+ talks, has a light pen, keeps my books, plays music and games, draws 3-D pictures, processes words, cracks codes and cyphers and many other things too numerous to mention. One difficulty I have is getting the thrill of high scores on games like younger people can usually do. Running out of ships, men or time can be a real bummer. I have kept my subscription to Hardcore since the info between its covers is worth the price. I can modify games to make up for my slower reflexes and I can modify utilities to better fit my applications.

Hardcore COMPUTIST serves these purposes. Each issue is thin enough, without having its space filled with information that is irrelevant to me.

As more Apple II series owners become aware of your magazine, your circulation should increase accordingly. As your income permits, you can develop sister publications for the users of other computers, letting them evolve the way Hardcore has.

Thank you for your consideration of my opinion.

Milo Von Tressel
Savanna IL

I really enjoy your magazine, all the more so since many of the other Apple magazines have gone "soft core". If you decide to cover IBM (hate 'em) or Macintosh, please implement it as separate issues, as those machines have no relevance to me.

William E. Krantz, Jr.
North Wales PA

I was very upset when I saw that you are considering expanding Hardcore COMPUTIST for other computers. Please don't!! Once you start to expand to other micro's, there is no stopping. We will end up with a magazine that has just a few pages on each micro. If you do expand to other computers, please do so by creating a new magazine for each computer.

Taco Van Ieperen
Calgary, Alberta
Canada

Other Owners Respond, Too

Re **Hardcore COMPUTIST No. 11**.

Page 5: Yes! Macintosh! IBM PC!

Page 0: Applied Engineering ad: The reference to Z-80 Plus is somewhat dishonest. The "4MHZ" is really 3.58, but more importantly, "High Speed" is misleading. It is no faster than standard softcard or its clones in the Apple II Plus.

Keith Davison
Brookline MA

In your **Hardcore COMPUTIST No. 11**, **Page 5**, you request an opinion on whether we would like to see information related to copy protection on other (than Apple) popular micros.

The answer is a resounding yes for the IBM-PC. You will note in Softalk that COPY II Plus is a best-seller.

If you decide to go ahead on this project, please notify me so I can subscribe.

A.M. Platt
Richland WA

Super IOB Problem

I am having two problems with the **Super IOB** program which appeared in **Hardcore COMPUTIST No. 9**: — *page 11*

1) Line 10100 of the program is giving me a fit because I can't tell how many blank

READERS' SOFTKEY & COPY EXCHANGE

Deprotecting Snooper Troops (Case #2)

By Jim Mitchell

Spinnaker Software
215 First St.
Cambridge MA 02142
\$44.95

Requirements:

Snooper Troops Case #2
One blank diskette
System Master diskette
Super IOB

Snooper Troops II is an educational game by Spinnaker Software for ages 10 to adult. This game and Snooper Troops I are copy protected in exactly the same way and cannot be backed-up using the usual copy programs. However, they can be transformed into COPYA form without too much difficulty.

The copy protection consists of changing the address field header from D5 AA 96 to BB AA 96, and leaving track \$09 empty (actually filled with \$FF's). When Snooper Troops is copied with Locksmith or Copy][plus, the disk will boot and send you off to track \$09 where you will stay until you boot another disk. To change this program into the friendlier COPYA form, all you need to do is use a Super IOB controller to read the address field header as BB AA 96, and write the track back onto an empty disk with the normal D5 AA 96 address field header. When all the tracks have been transferred to the new disk, DOS 3.3 will be written onto the disk using the Master Create program from the System Master diskette. You should then have an unprotected copy of Snooper Troops, Case #2, which you may examine or modify at your leisure.

Procedure:

- 1) Type in and save the Super IOB controller at the end of this article.
- 2) Next, save the program in case of an error. I also suggest that you write-protect your original copy of Snooper Troops to protect it during this procedure, but be sure to remove it before running the program because it will not run properly, otherwise.
- 3) Run Super IOB and follow the prompts that the program will display on your monitor. Note that your drive will make noise when reading tracks \$00 and \$09. Do not interrupt the procedure. Just ignore the noise if possible; it will not affect the finished product. Also, note that tracks \$00 through \$02 will not be copied.
- 4) When the copy is completed, remove the original copy of Snooper Troops and place it in a safe location.
- 5) Insert your System Master diskette and execute the master create program.

BRUN MASTER CREATE

6) When asked for the name of the greeting program, type HELLO.

7) Now insert your new copy of Snooper Troops that you just made with Super IOB and press RETURN. DOS 3.3 will now be written onto the disk and, when the disk is booted, the HELLO program will automatically run.

You may now CATALOG the disk, examine the program, and modify it if you like. You may also copy the new disk using COPYA or any other copy program.

This program will also allow you to make a backup copy of Snooper Troops, Case #1. I have not attempted to use it on any other programs from Spinnaker Software, but I suspect that it might work on some of them. It will also work on Piece of Cake, an educational math program by Counter Point Software, which I found to have a nearly identical protection scheme. No changes to the program are necessary.

Snooper Troops Controller

```

Softkey For DLM Software

By Chris Chenault &
Ray Darrah

Development Learning Materials
1 DLM Park
Allen, TX 75002

\$39.00

Requirements:

48K Apple or Apple //e
Super IOB from Issue No. 9
A blank disk
Alligator Mix, Demolition Division, Alien
Addition or Minus Mission

Demolition Division is a drill that makes division fun for youngsters. In this game, you use your correct answers to shoot enemy tanks. You have a choice of speed, difficulty and paddle or keyboard control.

Alligator Mix is a math drill that consists of a mixture of addition and subtraction problems. In this game, you can only feed the alligator if the answer to the addition or subtraction problem matches the answer he has on his tummy.

Alien Addition is an addition drill made into an arcade game. The game gives you the ability to change speed and difficulty levels and is one of many great education games that offer children fun while they learn.

In Minus Mission, falling blobs of subtraction problems threaten to overcome a robot with green slime. Arcade skill is required as well as subtraction skill to save the robot.

For all of these great programs, I have developed a Super IOB controller that deprotects them nicely. I think it may work on other DLM releases as well as the four mentioned above.

In any case, here are the steps to follow when deprotecting one of these educational masterpieces:

- 1) Type in the Super IOB controller at the end of this article and save it.
- 2) Next, boot a normal DOS diskette and initialize a blank disk with the filename the same as the disk you wish to copy (Ex. if you want to copy Minus Mission, type INIT MINUS MISSION).

INIT program name

3) Execute the Super IOB program with the DLM controller installed.

4) When Super IOB is finished, try to boot the copy. If everything comes up OK then you're finished. If you get a "FILE NOT FOUND", CATALOG the disk and RUN the first file you see. This should have been the program name you used in step 2. You may go back to step 2 and try again if you like.

DLM Controller

```
1000 REM DLM SOFTWARE CONTROLLER
1010 TK = 3 : ST = 0 : LT = 35 : CD = WR : MB
      = 130 : DOS = 13
1015 GOSUB 360 : GOSUB 270 : GOSUB 360
1020 T1 = TK : GOSUB 490 : GOSUB 360 :
      ONERR GOTO 550
1030 GOSUB 430 : GOSUB 100 : ST = ST + 1
      : IF ST < DOS THEN 1030
```

```

1040 IF BF THEN 1060
1050 ST = 0 : TK = TK + 1 : IF TK < LT
    THEN 1030
1060 GOSUB 490 : TK = T1 : ST = 0 : GOSUB
    360
1070 GOSUB 430 : GOSUB 100 : ST = ST + 1
    : IF ST < DOS THEN 1070
1080 ST = 0 : TK = TK + 1 : IF BF = 0 AND
    TK < LT THEN 1070
1090 IF TK < LT THEN 1020
1100 HOME : PRINT "EVERYTHING O.K. ^
    NO^DOS^ON^COPY" : END
10010 PRINT CHR$(4)
    "BLOAD^RWTS.13,AS1900"

```

Controller Checksums

```

Softkey For Learning With Leeper

By Marco Hunter

Learning with Leeper
Sierra On-Line Inc.
Sierra On-Line Building
Coarsegold, CA 93614
(209) 683-6858
\$34.95

Requirements:

48K Apple or compatible
One disk drive and DOS 3.3
COPYA
A sector editor
A blank disk
Learning with Leeper

The three things you can count on in this life are death, taxes, and Sierra On-Line's nibble counts. With this in mind, I tackled Learning with Leeper, a recent educational release from Sierra. I quickly discovered that, as usual, the disk is normal DOS 3.3. This means it is easily copied with COPYA (although it will not work correctly). Then, after some trial and error copying, I discovered that the nibble count checks track 0. This was also standard Sierra.

Tracks \$00, \$03, and \$1F are popular tracks for Sierra On-Line nibble counts. Finally, I decided to go all out and remove the nibble count entirely. Well, as it turned out, it wasn't that tough. When I finally found the nibble count routine, I decided that the easiest thing to do was simply avoid jumping into it, rather than trying to modify it.

Here are the steps to deprotect Learning With Leeper:

- 1) Boot system master.
- 2) Make a regular backup of Learning with Leeper.

RUN COPYA

3) Use your sector editor to modify these bytes on the new copy eliminating the nibble count routine.

Track	Sector	Byte	From	To
\$03	\$0F	\$2C	\$20	\$EA
\$03	\$0F	\$2D	\$00	\$EA
\$03	\$0F	\$2E	\$12	\$EA

That's all there is to deprotecting Learning With Leeper. Have fun with the backup.

Softkey For TellStar

By William Wingfield, Jr.

TellStar
Information Unlimited Software
281 Arlington Avenue
Berkeley, CA 94707
\$39.95 Level 1
\$79.95 Level 2

Requirements:

Apple][Plus or //e
Inspector/Watson
Initialized 3.3 disk

TellStar is an absolutely amazing program. It is great to have around for the people that look at the Apple and say, "So what does it do other than play games?" I have yet to see anyone who hasn't been impressed by TellStar's information of the night sky. The program does have one slight problem, though. Copy protection. That problem can be remedied quite easily so that the program can be viewed and reduced in size from a whole disk to 326 sectors.

There are two parts to the protection scheme for this program. The first is an altered 3.2 format. The second is a phony catalog on track \$11; the real catalog is on \$15. It's good to know that someone puts those Beagle Brothers tip books to use. We'll use Muffin as our 3.2 code source and to transfer the files when we are ready.

The first thing to do is to fix the catalog so that Muffin can find the files. We'll be writing to the TellStar disk, so use a backup to be on the safe side.

- 1) Boot the Master disk and install Inspector (or Watson) and load Muffin.

BLOAD MUFFIN

- 2) Now we'll fix the 3.2 code to match that used by TS. You can make the changes from Inspector or from the monitor. The last byte of the Address marker changes from track to track so we'll make DOS ignore it.

1A8A:29 00

- 3) The last byte of the End-of-Data marker has been changed to D5 so we'll match that next.

1A60:D5

- 4) Since we need to write to the disk, we must also match the bytes in the section of DOS

that does the writing. The last byte of the address marker on track \$11 is \$D6 (you may wish to verify the markers on your disk in the event that they aren't all the same) so we'll match it.

1FFF:D6

19E3:D5

- 5) Now to fix the CATALOG. Enter Inspector if you haven't already done so. Inspector uses \$3DA-3DB as a pointer for the RWTS it uses when accessing a disk. The RWTS for Muffin that we just altered is at \$1E00 so edit these bytes to \$00 and \$1E respectively. Next, go to a clean buffer such as \$50 and read in T\$11, S\$C. Bytes \$2 and \$3 show \$11 and \$0C, the fake CATALOG. Edit these to \$15 and \$09, the real catalog location, and write the sector back to the disk. Return the pointer on page 3 to \$B7B5 and exit Inspector.

- 6) Now to unlock the disk. Start up Muffin.

CALL 2051

- 7) Use "=" for FILE NAME and transfer all the files to the 3.3 disk. You can delete the file called REAL CAT (it just reserved space for the CATALOG on the protected disk). TELLSTAR I is the greeting program.
- 8) Exit from Muffin and load the greeting program.

LOAD TELLSTAR I

- 9) Eliminate the "POKE 214,255" from line 100.

Now if you RESET from within the program, it won't try to run itself every time you enter a command. You're finished! Grab a Pepsi and enjoy the feeling of having beaten THE PROTECTORS once again.

NORMALIZING Laf Pak

By FERRELL WHEELER

Laf Pak
Sierra On-Line
Sierra On-Line Building
Coarsegold, CA 93614

Requirements:

Laf Pak disk
1 blank disk
1 initialized disk (preferably with a fast DOS)
COPYA
Any sector editor program such as DiskEdit
or ZAP

Laf Pak is a collection of four small but very enjoyable and playable games. Number one in the pak is Creepy Corridors, a maze type game that is by far the most fun, especially with the hilarious sound effects. Apple Zap is a four way shoot'em up game. Space Race is a game in which you race an opponent or the computer through a multitude of little bird-like aliens. Finally, Mine Sweep is an almost impossible game in which you try to clear a mine field in a given amount of time.

In trying to backup this disk, I first noted that the publisher was Sierra On-Line. Many companies use a standard copy protection method on most of their products and I figured Laf Pak was protected, like most of their other products, with a nibble count on track 0. This turned out to be true. A check is made at the beginning of each of the individual games. It is always helpful to know of a company's past methods of copy protection when trying to unlock any of their software. For example, the original Zork crack published in Hardcore COMPUTIST No. 1 still works for all of Infocom's adventures, almost all of Automated Simulations software can be DeMuffled, and the boot code for Hard Hat Mack that was revealed in Hardcore COMPUTIST No. 5 can be used on some other Electronic Arts games. So always keep this in mind and don't throw away your back issues of Hardcore.

To disable the disk checking routines for Laf Pak, I simply had to find the first JSR (a subroutine call) at the beginning of each of the games and replace it with NOP's (no operation). For example: Creepy Corridors starts at \$800 and at \$808 there is a JSR \$1B33 which is the call to the disk verification scheme. In machine code this code is 20 33 1B, so I simply used a disk searcher to find these three bytes on the Laf Pak disk.

With Laf Pak this can easily be done since the disk is written in standard DOS 3.3 format. I found similar calls in the other three games and recorded the locations of all the bytes that needed to be changed to EA (op code for NOP). So, to backup Laf Pak simply use COPYA to copy the entire disk (always write-protect your original first!). Then use a sector editing program to make the following changes to the backup.

TRK	SECT	BYTE	FROM	TO
4	0	8	20	EA
4	0	9	33	EA
4	0	A	1B	EA
14	0	D	20	EA
14	0	E	0D	EA
14	0	F	72	EA
9	2	F	20	EA
9	2	10	7C	EA
9	2	11	13	EA
C	7	F	20	EA
C	7	10	33	EA
C	7	11	17	EA

You now have a completely unprotected backup of Laf Pak which can be copied with any standard copier. If this is all you want you can stop here, but I wasn't satisfied because using a full disk for a backup of a game is usually a waste of disk space. I wanted each game normalized, i.e. BRUNable and FIDable. I also wanted the Laf Pak machine to work as normal from a standard binary file.

Normalizing each game will illustrate the method of using memory moves to compact binary files and will also illustrate how to pass commands to DOS from within machine language programs. When we are done there will be plenty of room on the disk

for any other games you want to store with Laf Pak.

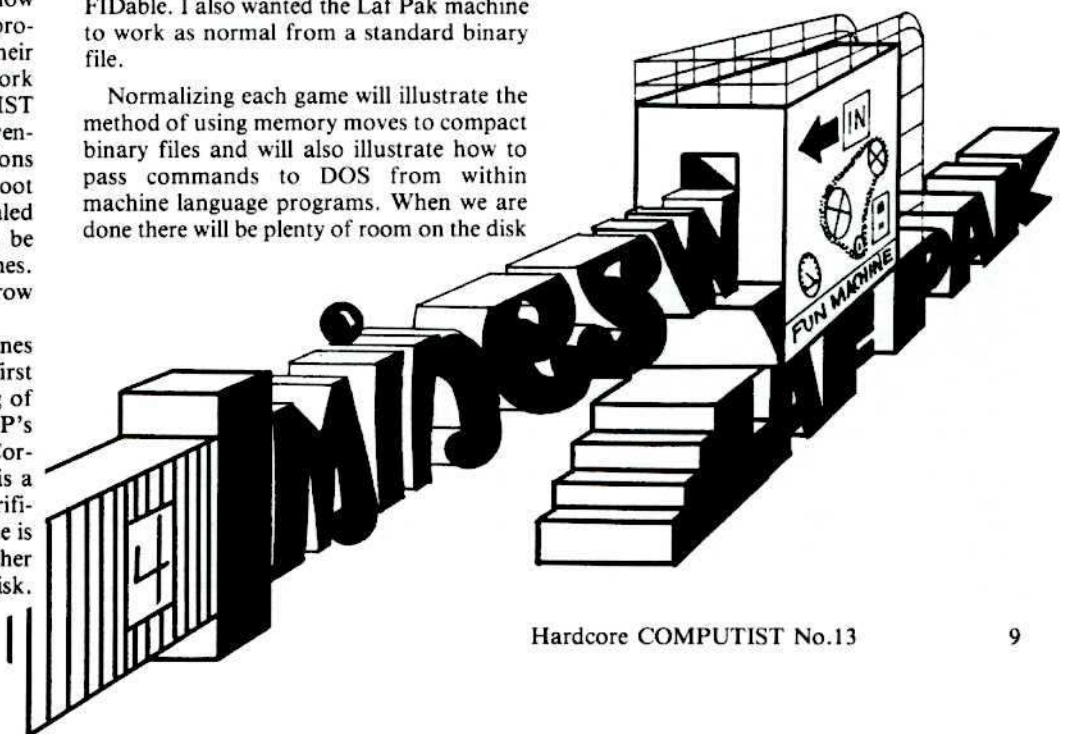

The first thing to do, while the sector editor is still handy, is to change the name of the file that is run on boot up. It is named LAF PAK, but is preceded with 7 ^{CTRL}H's. Since we will want to load this file in from hand, we need to get rid of the control characters. Use your sector editor to read in track 11, sector F and, beginning with byte 0E, type in LP (that's CC D0 in hex) and enough spaces (A0 in hex) to cover the 7 ^{CTRL}H's (88 in hex) and the ASCII codes for "LAF PAK". Write this sector back to disk. Now when you CATALOG your backup LAF PAK disk, the first file should be a 4 sector binary file named LP.

Before we actually begin you need to boot your initialized disk, type in the following code at \$800 and save it as PAGE MOVER.

CALL -151

```
800:A2 00 A0 FF 84 3E C8 84  
808:3C 84 42 BD 25 08 85 43  
810:E8 BD 25 08 85 3D E8 BD  
818:25 08 85 3F E8 20 2C FE  
820:E0 06 D0 DE 60 00 00 00
```

BSAVE PAGE MOVER, A\$800, L\$28

In assembly language this looks like:

```

0800- A2 00 LDX #500
0802- A0 FF LDY #5FF
0804- 84 3E STY $3E
0806- C8 INY
0807- 84 3C STY $3C
0809- 84 42 STY $42
080B- BD 25 08 LDA $0825,X
080E- 85 43 STA $43
0810- E8 INX

0814- 85 3D STA $3D
0816- E8 INX
0817- BD 25 08 LDA $0825,X
081A- 85 3F STA $3F
081C- E8 INX
081D- 20 2C FE JSR $FE2C
0820- E0 06 CPX #506
0822- D0 DE BNE $0802
0824- 60 RTS

```

This routine uses the monitor's move subroutine at \$FE2C (note the Y-register must be 0 on entry) to perform block page moves where a page is considered to be 256 bytes starting at an address of the form XX00, i.e. the low order byte is 00. If \$800 is considered the first byte of the routine, then the "table" begins at byte \$825. A table entry is 3 bytes designating which pages to move and where. For example- if I wanted the monitor to perform the following move:

1100 < 2200.33FFM

the table entry would be

825:11 22 33

You can have as many as 85 table entries but

Would You Like To Write For Hardcore COMPUTIST?

We welcome articles on a variety of subjects:

- * Softkeys * Utilities * General Interest
- * Hardware Modifications * Product Reviews
- * Adventure Tips * Bit-Copy Parameters
- * Do-it-yourself hardware projects
- * Original Programs * DOS Modifications
- * Advanced Playing Techniques

Send your submission on a DOS 3.3 disk using an Apple (or compatible) editing program and enclose a double-spaced hard-copy manuscript. Submissions will be returned only if adequate return packaging is included.

Hardcore COMPUTIST pays on publication. Rate of payment depends on the amount of editing necessary and the length of the article (between \$10 for a short softkey and \$50 per typeset page for a full-length article.) Please enclose the original commercial disk for verification of softkeys. We guarantee the disk's return.

Softkey Publishing buys all rights and one-time reprint rights on general articles, and exclusive rights on programs.

For a copy of our WRITER'S GUIDE, send a business-sized (20-cent) SASE (self-addressed, stamped envelope) to:

Hardcore COMPUTIST, WRITER'S GUIDE,
POB 44549-T, TACOMA WA 98444.

you must set byte \$21 to 3 times the number of memory moves to be performed (in other words, set it to the total number of bytes in the table). As long as you load this code on a page boundary, then bytes \$0D, \$13 and \$19 are the only bytes you have to change to relocate the code. These locations should hold the high byte of the page to which you relocate the code. If you are using an assembler, you can make all of these changes in the source code by simply changing the origin and the contents of the table.

Our goal is to have 5 binary files, the 4 games and the menu or "Fun Machine" file which we will name LAF PAK. We will change the menu file to simply BRUN the selected game instead of loading it in directly from disk as it does on the original disk. On the original, when you are playing any of the games and you hit <ESC>, the game will BRUN a file called BOOT.OBJ which in turn loads in the menu. We will simply change each game to BRUN LAF PAK instead of BOOT.OBJ.

The first thing we need to do is to save each of the games. I will illustrate all of the steps in detail for the first game, Creepy Corridors.

Creepy Corridors

1) Boot the initialized disk on which you saved PAGE MOVER (preferably a disk with a fast DOS on it). Insert your Laf Pak backup, load the boot up file LP and get into the monitor.

**BLOAD LP
CALL -151**

2) LP starts at \$1400 where it first reads in the I/O routine at \$220. Whatever the accumulator is holding on entry to \$220 determines which game (or the menu) is to be loaded. A 0 means Creepy Corridors and a 4 means the menu. At \$1438, the accumulator is loaded with 4 (indicating that the menu is to be loaded) and a jump is made to \$220. We can change this JMP instruction (4C in hex) to a 60 (RTS) so that the I/O routine will be loaded, but not executed. To do this type

143A:60 N 1400G

Upon examination of the I/O routine at \$220, you can see that each game and the menu are loaded in three separate chunks. The destination addresses and the number of pages to be loaded in each chunk are given in the tables at \$2FA and \$2EB, respectively. With this information and a little bit of hexadecimal addition, the following addresses can be determined:

Creepy Corridors:

\$800-\$1CFF, \$4000-\$5FFF & \$7000-\$94FF

Space Race:

\$800-\$15FF, \$6000-\$6EFF & \$8000-\$93FF

Mine Sweep:

\$800-\$1EFF, \$4000-\$5FFF & \$8700-\$94FF

Apple Zap:

\$4000-\$5FFF, \$6000-\$7EFF & \$7D00-\$8CFF

Fun Machine (Menu):

\$800-\$EFFF, \$4000-\$60FF & \$9000-\$94FF

3) We are going to let the Laf Pak routine read in each game, then stop it before it jumps to the beginning of each game. This is done by changing the JMP at \$28A to a RTS.

28A:60

4) Now we just need to load the accumulator with 0 for Creepy Corridors and jump to \$220. This is done by changing the code at \$1438 so that the accumulator will contain a 0 when the I/O routine executes.

1439:00 4C N 1438G

5) The code is now in, so let's change BOOT.OBJ to LAF PAK so the menu will be loaded if the <ESC> key is hit.

14C5:CC C1 C6 A0 D0 C1 CB A0

6) We next can compact the 3 chunks of code into one contiguous block with the following memory moves.

1D00 < 4000.5FFF

3D00 < 7000.94FF

7) Since PAGE MOVER will live at the end of the block (at \$6200), we need to call this subroutine before the main program is run. So we put a JSR \$6200 at the beginning of the code.

7FD:20 00 62

8) Now insert the initialized disk with PAGE MOVER on it, load it in and change it so that it will run at this new location.

BLOAD PAGE MOVER,AS6200

620D:62 N 6213:62 N 6219:62

9) Note that the inverse of the moves made in step 6 are 7000 < 3D00.61FFM & 4000 < 1D00.3CFFM, which give us the table entries for the move code.

6225:70 3D 61 40 1D 3C

10) Now, simply save the game.

**BSAVE CREEPY CORRIDORS,
AS7FD,LS5A80**

You now have a completely normalized Creepy Corridors game which can be BRUN to your heart's content. Before going on, you should test it by first clearing memory and then running it from disk. An easy way to clear memory without turning your Apple off is by typing:

800:00 N 801 < 800.9500M

If something goes wrong, BLOAD the file and check the code at \$6200 for any typos.

In case you got lost along the way, here are the basic steps we performed in order to capture a compacted version of Creepy Corridors.

- A. Load the game into memory
- B. Compact the game code into one contiguous area of memory

- C. Append the PAGE MOVER routine onto the end of the compacted code and fix it so it will run properly there
- D. Put the proper values into the PAGE MOVER table
- E. BSAVE the game after inserting some code at \$7FD that calls the PAGE MOVER routine before the game tries to execute

When the game is BRUN the first thing that happens is call to the PAGE MOVER routine to "decompact" the code.

For the other three games, the steps are very similar to those we performed for Creepy Corridors.

Space Race

Steps 1-3 are the same as for Creepy Corridors.

- 4) The Accumulator should hold a 1 so that Space Race will be loaded.

1439:01 4C N 1438G

- 5) Change BOOT.OBJ to LAF-PAK.

**962:8D 84 C2 D2 D5 CE A0 CC
96A:C1 C6 A0 D0 C1 CB**

- 6) Compact the game's code with the following memory moves.

**1600 < 6000.6EFFM
2500 < 8000.93FFM**

- 7) Insert the code which calls the PAGE MOVER routine.

7FD:20 00 39

- 8) Insert the initialized disk, load the move routine and relocate it.

**BLOAD PAGE MOVER,AS3900
390D:39 N 3913:39 N 3919:39**

- 9) Put in the table for PAGE MOVER.

3925:80 25 38 60 16 24

- 10) Save the game.

BSAVE SPACE RACE,AS7FD,LS3180

Mine Sweep

Steps 1-3 are the same.

- 4) The accumulator should hold a 2 so that Mine Sweep is loaded in.

1439:02 4C N 1438G

- 5) Change BOOT.OBJ to LAF PAK.

96D:CC C1 C6 A0 D0 C1 CB A0

- 6) Compact the code with the following memory moves.

**2900 < 800.1EFFM
6000 < 8700.94FFM**

- 7) Insert some code which calls the PAGE MOVER routine and jumps to the start of the game.

28FA:20 00 6E 4C 00 08

- 8) Insert the initialized disk, load PAGE MOVER and relocate it.

**BLOAD PAGE MOVER,AS6E00
6E0D:6E N 6E13:6E N 6E19:6E**

- 9) Install the memory move table at \$6E25.

6E25:87 60 6D 08 29 3F

- 10) Finally, save the game.

BSAVE MINE SWEEP,AS28FA,LS4580

Apple Zap

Steps 1-3 are the same.

- 4) The accumulator should hold a 3 so that Apple Zap is loaded.

1439:03 4C N 1438G

- 5) Change BOOT.OBJ to LAF PAK

63BD:CC C1 C6 A0 D0 C1 CB A0

- 6) No moves are necessary since the code is already contiguous.

- 7) Insert the code which jumps to the beginning of the game.

3FFD:4C 00 60

Steps 8-9 are not needed because PAGE MOVER is not used with this game.

- 10) Insert the initialized disk and save the program.

BSAVE APPLE ZAP,AS3FFD,LS4D03

Before we move on to the menu program, I would like to note that Mine Sweep, Apple Zap and the menu all store standard hires pictures at \$4000-\$5FFF. Those of you who are ambitious and wish to save about 50 more disk sectors can pack these pictures and insert the unpacking routine with them to make these files even more compact. If you just want to be able to BRUN each of the games and do not care about the "Fun Machine" menu, then you have completed this task and you can stop here. But if you would like to use the menu program on occasion, then read on.

The Fun Machine

Capturing the menu program is similar to the above except that we must intercept the jump to the I/O routine to load in a game and replace it with our own BRUN routine. At \$862, the number of the game that is chosen is utilized to get an address from an address table at \$D62. This address is stored in \$00.\$01 which is used as a vector to the correct entry into the I/O routine. We will place our own address table at \$D62 so that \$00.\$01 becomes a pointer to the correct game that should be run. We will then print out BRUN with the code:

**86C- LDY #506
86E- LDA \$0879,Y
871- JSR \$F0ED
874- DEY
875- BNE \$086E
877- JMP \$0E30
87A- N U R B <CTRL-D> <RET>**

At \$E30, we will place a routine that uses the address in \$00.\$01 to print the name of the game. The code to do this looks like:

**E30- LDY #500
E32- LDA (\$00),Y
E34- JSR \$F0ED
E37- INY
E38- BNE \$0E32**

The result is that DOS will BRUN the desired game from the Fun Machine menu. All of the steps are summarized as follows:

Steps 1-3 are the same as above.

- 4) The accumulator should hold a 4 so that the menu is loaded.

1439:04 4C N 1438G

- 5.1) Type in the code below which will print out the DOS command BRUN (preceded by a carriage return and a ^{CTRL}D).

**86C:A0 06 B9 79 08 20 ED FD 88 D0
876:F7 4C 30 0E CE D5 D2 C2 84 8D**

- 5.2) Type in this code which will print out the name of the game to be run.

E30:A0 00 B1 00 20 ED FD C8 D0 F8

- 5.3) Next, install in memory a table which contains the names of the four games (each followed by a carriage return)

**E40:C3 D2 C5 C5 D0 D9 A0 C3
E48:CF D2 D2 C9 C4 CF D2 D3
E50:8D C1 D0 D0 CC C5 A0 DA
E58:C1 D0 8D D3 D0 C1 C3 C5
E60:A0 D2 C1 C3 C5 8D CD C9
E68:CE C5 A0 D3 D7 C5 C5 D0
E70:8D**

- 5.4) Now, put the addresses of the names in the address table.

D62:40 0E 51 0E 5B 0E 66 0E

- 6) Compact the menu code with the following memory moves.

**F00 < 4000.60FFM
3000 < 9000.94FFM**

- 7) Insert the code which calls the PAGE MOVER routine.

7FD:20 00 0E

- 8) Insert the initialized disk, load the PAGE MOVER and relocate it.

**BLOAD PAGE MOVER,ASE00
E0D:0E N E13:0E N E19:0E**

- 9) Install the PAGE MOVER table.

E25:40 0F 2F 90 30 34

- 10) Of course, we also have to save the compacted code for the menu.

BSAVE LAF PAK,AS7FD,LS2D03

Now you have a completely normalized Laf Pak that you can put on any one of your game disks. I hope the techniques I have illustrated will come handy when you are trying to normalize other copy-protected games.

Requirements:

Super IOB & swap controller
Blank disk

* See No. 15, page 5 - modified SWAP CONTROLLER -
** See No. 16, page 4 - (letter) - additional suggestions & values

9) When the copy is done, clear the program in memory.

FP

10) Type this short greeting program.

```
10 POKE 1010 ,105 : POKE 1011 ,255 :
   POKE 1012 ,90
20 PRINT CHR$(4) "BRUN^@INIT"
```

11) Save it on the copy of Beyond Castle Wolfenstein.

SAVE HELLO

Easy wasn't it! It almost makes you wonder why they bothered copy protecting the game in the first place.

You now have a working COPYable backup of Beyond Castle Wolfenstein. I suggest you put the original in the vault in your basement (or your bunker) and make a couple of copies of the backup before trying any of the APTs that follow.

HELLO!

The three POKES in the HELLO program set up the RESET vector so that when the RESET key is hit you will be placed in the Apple's monitor. This will allow you to perform some Advanced Placing Techniques that would have made a high-ranking officer of Waffen SS drool with envy.

The Map

The file BACKUP contains all the information about the standard castle, while the file CASTLE contains all the information about the current castle. Therefore, at the beginning of a mission in the standard castle the files BACKUP and CASTLE are identical.

Room Definitions

When BACKUP is BLOADED (A\$4004), the 61 room definitions each occupy 256 bytes starting at \$4100. If you wish to sector edit the file, each room definition occupies one sector starting with the second sector of the file.

Each room, except the first one, is defined with four exits. However, when the main program draws a room, it blocks the exits that don't lead to another room.

A new castle is created by changing the contents of each room and then shuffling the room definitions. This means that when you're playing a game with a different castle, you will encounter the same rooms, only in different places and with different objects in them.

Bytes \$00 through \$47 of each 256 byte long room definition define its walls. Each room is drawn on an eight by nine matrix with the seventy two squares having overlapping edges. The lower four bits of each byte in this area state whether to draw a specific wall of a particular square or not.

To see this, boot up the game and press RESET as soon as you are placed in the first room.

Now let's erase the wall definition of this room (while playing a game, the current room definition resides at \$4000 through \$40FF)

```
4000:00
4001 < 4000.4046M
```

To see this completely blank room, type 1290G, but don't leave the room as you will go to strange places and most assuredly not get back. When you finish looking at this bland site, hit RESET to get back into the monitor.

Now let's fully illuminate the upper left and lower right squares:

```
4000:0F
4047:0F
1290G
```

Entire squares lit up because all of the lower four bits were set to 1. If you don't want an entire square, then a value representing which walls you want illuminated should be stored in bytes \$00 through \$47. Bit 0 controls the left wall, bit 1 controls the right wall, bit 2 controls the top wall and bit 3 controls the bottom wall.

If you would like to design your own wall definitions, remember that the squares overlap. To see this, set \$4000 and \$4001 to \$0F and type 1290G.

Which Room Is Where?

The rooms are numbered. When BACKUP or CASTLE is BLOADED, room one is at \$4100 (1st in the file), room two is at \$4200 (2nd in the file), and so on. Bytes \$49

Beyond Castle Wolfenstein is a highly improved version of the original Muse program, Castle Wolfenstein. This newer version has better voice synthesis, smoother graphics and higher playability. The program will also utilize a 16K RAM card for the storage of the castle so that no disk access is required when moving from room to room.

Unfortunately, Muse is still copy protecting their programs. Since I was anxious to perform some APTs, I decided to deprotect the game.

The Softkey

The softkey is performed quickly with a little help from the Super IOB swap controller:

1) Begin by booting Beyond Castle Wolfenstein.

PR#6

2) The instant you see the Applesoft prompt, hit RESET. The computer should then beep and put you in the monitor.

3) Move the Wolfenstein RWTS out of the way so we can boot a slave disk.

```
1900 < B800.BFFFFM
```

4) Boot your 48K slave disk (Super IOB disk).

```
6^CTRL P
```

5) Save the RWTS from Beyond Castle Wolfenstein.

```
BSAVE RWTS.BEYOND WOLF,
AS1900, LS800
```

6) Remove your Super IOB disk. Put a blank diskette in the drive and Initialize it.

```
INIT HELLO
```

7) Install the controller printed at the end of this article into Super IOB and RUN it.

8) Follow the prompts and do NOT format the backup.

BENEATH

BEYOND CASTLE Wolfenstein

By Ray Darrah

*** See No.16, Page 19 (fix for this SOFTKEY)

through \$4C of a room definition hold the numbers of the rooms to the left, right, top, and bottom, respectively. If one of these bytes is less than one or greater than sixty-one, then there is no room in that direction and when the room is drawn the corresponding exit will be blocked.

The Items In The Room

Bytes \$80 through \$FF contain definitions of the items in this room. As far as I can tell, each item (except closets) take up eight bytes. Closets seem to occupy sixteen bytes. With this assumption, the table below gives the offsets in the sector (or page of memory) for each of the item definitions:

Item	Bytes	:	Item	Bytes
1	\$80 - \$87	:	9	\$C0 - \$C7
2	\$88 - \$8F	:	10	\$C8 - \$CF
3	\$90 - \$97	:	11	\$D0 - \$D7
4	\$98 - \$9F	:	12	\$D8 - \$DF
5	\$A0 - \$A7	:	13	\$E0 - \$E7
6	\$A8 - \$AF	:	14	\$E8 - \$EF
7	\$B0 - \$B7	:	15	\$F0 - \$F7
8	\$B8 - \$BF	:	16	\$F8 - \$FF

In each of these item definitions, the first byte determines what the item is and the second byte is a value from \$00 to \$3F that determines where it will appear in the room. As far as Beyond Castle Wolfenstein is concerned, there are sixty-four positions in each room for either you, a German or some other item. Position \$00 is the upper left corner, position \$07 is the upper right corner and position \$3F is the lower right corner.

Here are the possible values that byte zero of the item definitions can hold:

Value	Item	:	Value	Item
\$10	- Alive Guard	:	\$40	- Dead Guard
\$20	- Closet	:	\$50	- Desk Clerk
\$30	- Alarm Button	:	\$60	- Super Wall

I haven't determined what the other bytes in the item definitions are for. However, I do know that byte \$02 of a closet definition holds a value representing what will be found in the closet. These values are:

Value	Contents	:	Value	Contents
\$01	- Bullets	:	\$09	- Hitler's Diary
\$02	- Money	:	\$0A	- Alarm Controls
\$03	- Passes	:	\$0B	- Dagger
\$04	- Powder Kegs	:	\$0C	- First Aid Kit
\$05	- Coat Check	:	\$0D	- Tool Kit
\$06	- Art Objects	:	\$0E	- Secret Passage
\$07	- Keys1	:	\$0F	- The Bomb
\$08	- Keys2	:		

I also know that byte \$04 determines whether the closet is open or not. An open closet will have a value of \$00 and a closed closet will have a value of \$F0.

To Help You Along

To aid you in the conquering of Beyond Castle Wolfenstein, here are some helpful APTs. All of them require you to press RESET before performing them. If no command is specified, start the program by

typing

1290G (get going again)

If ever you feel that the number of bullets in your revolver is inadequate for the massacre ahead of you, RESET into the monitor and type

4347:0A (# of bullets)

This will give you ten bullets. You may put any hex number from \$00 to \$FF here. Numbers greater than ten will be displayed on the inventory screen as ten bullets but you will really have how ever many you typed.

If you prefer to be a slaughtering machine, infinite bullets can be obtained by typing

15AE:EA EA EA (infinite bullets)

Perhaps you're not the killer type. Maybe you would rather bribe everyone. If this is the case, then you may alter the amount of money you have at any time by typing

434B:64 (amount of money)

This will give you 100 marks because \$64 is 100 in decimal. Care must be taken not to give yourself more than 100 marks. If you have more than 100 marks when you try to bribe someone, you will be recognized.

Again on the milder side, the passes are stored at location \$4360. The lower five bits are 1 if you have that pass and zero if you don't. Therefore, if you wish to have every pass, you would type

4360:1F (which passes)

Instantly, you can acquire a dagger or a tool kit by changing the following values from \$00 to \$FF:

4306:FF (dagger)

4307:FF (tool kit)

If, with all this, you still manage to get injured, you can obtain a first aid kit by typing

4308:02 (number of bandages)

This will give you two bandages. You may enter as many bandages as you like. As long as you have at least one bandage left, there will be a first aid kit on the inventory screen.

On the other hand, if you don't wish to bother bandaging yourself every time you get shot, then you can try:

59BA:EA EA EA (forever healthy)

This will have the effect of nulling all wounds. This means that the game will still tell you when you are injured, but you won't slow down when you walk. You see, location \$432B holds the delay constant to be used when you walk. A zero is no delay and you can walk fine. This value is changed to \$16 the first time you are injured with the effect of making you limp. When you are severely wounded, this location holds a \$76 which makes the delay routine wait a long time

Most Wanted List

If you have been trying to backup a program, and have only ended up pulling your hair out as a result of the ordeal, let us know about it.

We have received softkeys for a number of programs previously in our list and these will be published as soon as each has been evaluated and edited by our staff.

Softkey For Transylvania & The Quest

By Thomas A. Phelps

Requirements:

Apple][,][+, //e, or compatible
Three blank disk sides
(one for Transylvania and two for The
Quest)
Transylvania and The Quest disks

As you are aware, both Penguin Software and Beagle Bros are spoken of highly for their unprotected applications disks. Even the Beagle game disk Beagle Bag bears no protection. Penguin game disks, on the other hand, are copy-protected, thus not allowing easy backup nor the art of APT. Arcade games in broken form do not especially lend themselves well to APT due to difficult to understand machine code, but adventures, especially ones written in BASIC, do. After performing the softkey for both Transylvania and The Quest you can examine the BASIC programs which are the core of these fine adventures, as well as each well-drawn picture without the need of traveling there in the adventure itself.

The protection for these adventures is more or less the same, and is easily broken with just a little effort. First, type in the following Super IOB controller. Since this controller works on all Penguin entertainment software I've tried (including such releases as Coveted Mirror), save it to disk as PENGUIN.CON.

After using the controller on a Penguin disk, you should add DOS (ideally HYPERDOS from the Hardcore flyer or Update 3.2 of the old series). Now follow the softkeys to unlock Transylvania and The Quest, and enjoy the APT's!

Transylvania Softkey

First, run Super IOB with the Penguin controller installed. Once the program has been copied only one modification needs to be made for the program to function. The Binary file TPAR checks to see that \$D6 is nonzero (causing the BASIC program to autorun). If it is not nonzero, the program will

exit to BASIC as soon as the player is ready to enter his first command. This problem can be fixed in either one of two ways. One way is to add "5 POKE 214,255" to HELLO, or, better yet, the file TPAR can be modified to ignore this check. To modify TPAR, follow these steps:

1) Since TPAR loads in an area normally used by DOS buffers, change Maxfiles

MAXFILES1

2) Load in the file to be modified

BLOAD TPAR

3) Enter the monitor

CALL - 151

4) NOP the \$D6 byte check

943D:EA EA EA

5) Save the new file

BSAVE TPAR,AS9400,LS69D

For a complete, stand-alone copy, simply copy DOS onto the disk and use HELLO as the boot-up program.

According to the VTOC, the disk has no free sectors, but a VTOC rebuilder will show several free sectors which may be used to store saved games and the APT programs below (no extra disk needed!).

APT For Transylvania

In addition to this bit of protection, TPAR contains a list of all the words the adventure understands. A utility that prints out disk files, or the program below will print a complete list of recognized words if TPAR is in memory (the periods just fill out commands requiring less than five letters).

Print Commands

```
5 PR# 1 : PRINT
10 ST = 38281 : EN = 37888 + 1693
15 COL = 80 : REM # COLUMNS PRINTER
SUPPORTS , SET TO FIVE FOR EACH
RECOGNIZED WORD TO BE ON ITS OWN
LINE
20 FOR I = ST TO EN : PRINT CHR$( PEEK
(I ) );
30 NN = NN + 1 : IF NN = COL THEN PRINT
CHR$( 13 ) : NN = 1
40 NEXT I : PRINT CHR$( 13 )
45 PR# 0
```

Checksums

5	- \$D66E	30	- \$84BF
10	- \$F8CD	40	- \$8C63
15	- \$6A49	45	- \$D328
20	- \$32D2		

Examining the BASIC program TRANS will give you some clues and show some interesting program techniques; it's worth looking at.

Another benefit of unlocking this Transylvania is that the beautiful hi-res pictures can be enjoyed without the bother of traveling through the entire adventure.

Owners of the Graphics Magician can load up the pictures just as if they were any other picture created with the picture editor, or those without can use the following program to take a look at the pictures (save to the Transylvania disk under SEE PICTURES).

See Pictures

```
10 IF PEEK (103) + PEEK (104) <> 65
THEN POKE 103 , 1 : POKE 104 , 64 :
POKE 16384 , 0 : PRINT CHR$( 4 )
"RUN^SEE^PICTURES"
20 TEXT : HOME : HGR : PRINT CHR$( 4 )
"BLOADPICDRAW2"
30 HOME : VTAB 21 : INPUT "SEE^
PICTURE^->^" ; AS : IF LEFT$( AS
, 3 ) <> "CAT" THEN 50
40 TEXT : HOME : PRINT CHR$( 4 )
"CATALOG" : PRINT "ANY^
KEY^" ; : GET AS : PRINT AS : HGR :
GOTO 30
50 IF AS = "" OR AS = "END" THEN TEXT :
HOME : END
60 PRINT CHR$( 4 ) "BLOAD^" AS
" , A4608" : POKE 2560 , 0 : POKE
2561 , 18 : CALL 2608
70 GOTO 30
```

Checksums

10	- \$2437	50	- \$C073
20	- \$37EF	60	- \$03F6
30	- \$E771	70	- \$EC38
40	- \$374A		

The possibilities for modification are endless; you can even modify the adventure map!

The Quest Softkey

The softkey for The Quest is less complex than the softkey for Transylvania. You need to use the Penguin controller on the boot side of the disk and, interestingly enough, only COPYA on the back side.

After that, a couple of modifications need to be made. First of all, the boot program needs to be changed so that a file called AMP 2.8 can be BLOADED into the DOS buffers. Type the following:

```
FP
10 PRINT CHR$(4) "MAXFILES1" :
PRINT CHR$(4) "BRUN QUEST
SAVE QA
```

Copy DOS onto the disk and use QA as the boot-up program.

The next modification concerns a check to see if Penguin DOS is still in the machine. The check occurs in line 9120 of a program called QB so

LOAD QB

Change the Z = PEEK (47092) in line 9120 to a Z = PEEK (47093) and then

SAVE QB

Like Transylvania, the disk shows no free sectors, but a CATALOG rebuilder (such as

FIXCAT from Bag of Tricks which was unlocked in Hardcore Computist No.3) will recover the unused sectors which can now be used for saved games.

APT For The Quest

The end of this adventure is much, much better than that of Transylvania. In fact, to see the end without toiling with the adventure, flip the disk to side two and BRUN EQA. Excellent work on the part of the authors and on the COPYABLE side - interesting.

Again, all the hi-res pictures may be viewed but, disappointingly, many are duplicates. The BASIC program MQ can also be examined to aid in solving this adventure.

Final Word

As I mentioned earlier, Super IOB works on other Penguin game disks as well. For example, running Super IOB on Minute Man and simply changing line one to "I HOME: HGR: HGR2: PRINT CHR\$(4) "MAXFILES!" will create an unlocked Minute Man which, of course, may be copied with COPYA or any other copier, even FID!

Well, that's it! Watch for the return of three mice in The Quest, and have fun!

Penguin Controller

```
1000 REMPENGUIN CONTROLLER

CSaver: The Advanced Way To Store Super IOB Controllers

By Ray Darrah

Requirements:

Apple II with Applesoft in ROM
16k RAM (or language) card
DOS 3.3 (not PRODOS)

After reading Ken Burnell's letter in Hardcore COMPUTIST No. 12, I realized that saving Super IOB controllers with "The Controller Saver" from Hardcore COMPUTIST No. 10 isn't as convenient as &Holding and &Merging them. Therefore, in my spare time I wrote CSAVER (pronounced "See saver") which adds the capability of holding programs and merging them.

page 4

page 11

Typing It In

Entering the CSAVER is quite simple. Merely type in the hexdump at the end of this article and

```
BSAVE CSAVER,A$4000,LS111
```

To install the CSAVER, type
BRUN CSAVER

It will appear as if nothing has happened to your precious computer but, in fact, all kinds of strange and wondrous events have occurred: Your entire language card has been filled with the image of your Applesoft ROMS; a small routine that hides and merges programs has been relocated into page \$F7 of your language card; a short routine that calls the hider and merger at \$F700 has been placed in the end of page three; and the ampersand has been revector to the short page three routine.

How To Use The CSAVER

Once CSAVER has been installed, you should LOAD (yes, an Applesoft file) the controller and then type

&H

This will put the controller on hold and allow you to LOAD SUPER IOB. With Super IOB in memory, you should merge the programs by typing

&M

It is important to note that when the two programs are merged, the one on hold takes

precedence over the one LOADED second. That is: *Lines of the program just LOADED will be overwritten (by the program on hold) where the line numbers are the same.*

CSAVER will work on most programs that you wish to merge. Just be sure to LOAD the program you wish to have precedence, first.

The Inner Workings

Those of you who get a little queasy when the conversation swings toward machine language might avoid some discomfort by skipping the following text.

When CSAVER is BRUN, the ampersand JuMP vector is set to \$3B5. Next, memory locations \$403D through \$4057 are copied into locations \$3B5 through \$3CF. Third, the code from \$401A through \$4032 copies the Applesoft ROMs into the language card. The last thing to happen is that the main routines of the CSAVER (locations \$4058 through \$4110) are copied into the language card starting at \$F700. This area is usually occupied by the hi-res routines HPLLOT, ROT= and XDRAW etc. But since CSAVER's main routines don't use any hi-res routines while holding or merging programs, they can occupy that area.

An Encountered Ampersand

When the Applesoft interpreter comes across the ampersand, it reads one more character (from the input line or BASIC program) into the A register and JuMPs to address \$3F5.

The routine at \$3F5 (placed there after CSAVER is BRUN) switches the RAM card so that it is just like RAM (you can read from and write to it) and then JuMPs to \$F700 which is the entry to the main routines of the CSAVER. The enabling of the language card in this manner is necessary because of a routine at \$F776 that is like the CHRGET routine (at location \$00B1) used by Applesoft.

The remainder of the routines in page 3 are used by CSAVER as exits. All of them start by disabling the language card and then (depending upon which exit) they JuMP to the final routines used by CSAVER.

The CSAVER Main Routines

First of all, CSAVER tests to see if a hold

"...saving Super IOB controllers with "The Controller Saver" from Hardcore COMPUTIST No. 10 isn't as convenient as &Holding and &Merging them. Therefore, in my spare time I wrote CSAVER..."

was specified. If not, execution continues at \$F72E.

The Hold Routine

If a hold was specified, then the code at \$F704 through \$F712 makes sure that the beginning of program is set \$801 (i.e. a program has not already been hidden). If the program pointer isn't set to \$801, then CSAVER exits via ERROR (at \$3BE) which disconnects the language card and JuMPs to \$FBE2 (the monitor bell routine).

Assuming the beginning of program pointer is set correctly, CSAVER then stores a \$801 into the fake CHRGET routine at \$F776. Next, it sets the beginning of program pointer equal to the end of program pointer and simultaneously calculates the length of the program and stores the answer in \$FE and \$FF. Finally, the hold routine exits via EXIT.HOLD (at \$3C4) which disconnects the language card and JuMPs to the Applesoft NEW routine (at \$D64B).

The Merge Routine

The code at \$F72E through \$F731 makes sure that a merge was specified. If not, execution goes to the ERROR routine. If a merge was specified, then the code at \$F732 through \$F73D makes sure that the beginning of program pointer is not set to \$801. If it is, CSAVER exits via ERROR. Otherwise, the pointer to the start of variables is set equal to the end of program pointer. This has the effect of erasing all numeric variables and is necessary for the ENTER.LINE routine called later.

Next, CSAVER sets the COUT vector to point to DO.1.LIN. This must be done because the ENTER.LINE routine doesn't end

with a RTS. Instead, it prints a prompt and waits for another line to enter. Therefore, by setting the COUT vector to DO.I.LIN as soon as ENTER.LINE prints the prompt, CSAVER takes over again.

The two PLA instructions at the beginning are meant to remove the JSR to COUT (in order to print the prompt) but eliminate the JSR to the Applesoft command handler the first time through. The two JSRs to CHRGET get the line link pointer. If the MSB is zero, then we have merged the whole program and execution continues at DONE.MERGE.

If the MSB wasn't zero, then DO.I.LIN sets the entry conditions for ENTER.LINE by making LINNUM equal to the line number we wish to enter, putting the tokenized line in the input buffer and setting register Y to 5 more than the length of the line. ENTER.LINE enters the tokenized line just as if you typed it.

CHRGET gets a byte from the program on hold, increments its pointer, and returns.

DONE.MERGE starts by setting the beginning of program pointer back to \$801 and then moves the merged program back to \$801 via the monitor MOVE routine. It does a PR#0 (JSR SETVID) so that the COUT vector is fixed and then reconnects DOS. Next, it fixes the start of variables pointer by subtracting the length from the end of program pointer. Last, it exits via EXIT.MERGE which disconnects the language card and then JuMPs to a routine in Applesoft which fixes the linnumber link numbers.

That's all there is to hiding and merging programs.

Adding New Commands To DOS 3.3

By Gary Peterson

C
O
R
R
E

One of the features that I liked about ProDOS, when I first saw it, was its ability to BLOAD and BSAVE any type of file to or from memory by specifying a T (for file type) parameter. With this ability you can, for example, put a text file into memory and manipulate it however you wish without having to use the extremely slow READ and WRITE commands. With ProDOS, the Byte (B) and Length (L) parameters can also be used in conjunction with BLOAD and BSAVE so that any range of bytes can be read from or written to any position in the file.

What I did not like about ProDOS, after using it for awhile, were its large memory requirements (so long, language card!) and its incompatibility with all of the DOS 3.3 programs I already owned. ProDOS might be fine for a hard disk based system, but it seems to be just a bit overblown for those of us with computers on low-megabyte diets.

A ProDOS Bug

After trying to use the BSAVE command with the Type and Byte parameters, I discovered that ProDOS had a bug in it which would crop up under certain conditions. Because of this bug, the BSAVE command would cease to operate properly after about 3 successive BSAVEs where the B parameter was specified (for an example of this bug and a patch for it, see page 20). However, Apple has corrected this bug in their latest release of ProDOS.

Aside from ProDOS, some of the DOS 3.3 enhancers (David-DOS, for example) have commands that let you load and save text files to and from memory. But what I really wanted was the ability to do this with any type of file in conjunction with Address, Length and Byte parameters. I decided to go ahead and try to implement these commands myself. Of course, a little research was first required.

The first place I looked for help was in CALL A.P.P.L.E.'s book, "All About DOS". There I found the code for a command called TYPE which will dump the contents of any type of file to the current output device. This command, although it is handy for looking at the contents of text files, did not have the capabilities for which I was searching. However, I did make a reference of address \$A2A8, labeled OPEN, which was commented as being a DOS subroutine which would open any file regardless of type. I also made note of how the author, Brian Matthews, had coerced DOS into accepting the TYPE command and its parameters.

Another article I found of interest in "All About DOS" was Text File Fast Loader by Robert Purves. In his article, Mr. Purves described how he implemented a DOS command called LTXT which allows you to read text files into memory. Except for the fact that it would only read text files, LTXT had the capabilities I wanted. An examination of the LTXT code was quite enlightening and I particularly made note of how the code for BLOAD was utilized to speed up the loading of the files into memory.

After reading these two articles and studying Beneath Apple DOS and Sandy Mossberg's Disassembly Lines columns in Nibble, I had a good idea of how to implement the new DOS commands. All I had to do was to write the code needed to do the job.

I expected to have a lot of problems getting the new commands to work properly, but the job did not turn out to be as difficult as I had anticipated. The final result was that I had two new DOS commands, called MREAD and MWRT, which did just what I had desired. The source code for these commands can be found in Listing 1 on page 19.

MREAD

Here are the basic steps which the code for MREAD goes through when reading a file:

- 1) Temporarily stores a File Manager opcode of 03 which indicates that a file is to be read.
- 2) Checks that Address and Length parameters were specified with the MREAD command. If the parameters were absent, a "SYNTAX ERROR" message is generated.
- 3) Does a call to \$A2A8 to open the desired file.
- 4) Checks to see if a Byte parameter was specified with the MREAD command. If it is present, \$A53B is called to position the "pointer" to the correct position in the file.
- 5) Retrieves the File Manager opcode and stores it in the File Manager parameter list at \$B5BB.
- 6) Stores an 02 at \$B5BC (File Manager Subcode) to indicate that a range of bytes is to be read.
- 7) Stores the length value from the command line into the proper locations (\$B5C1-\$B5C2) of the File Manager parameter list.
- 8) Enters the BLOAD command handler at \$A385 to load the file into memory.

MWRT

The operation of the MWRT code is pretty much the same as the MREAD code except

that the File Manager is passed an opcode of 04 for reading and the BSAVE command code is utilized instead of the BLOAD code. The MWRT code is a bit longer than the MREAD code because, when writing to a file, the length parameter in the File Manager parameter list must be one less than the actual number of bytes to be written. This is taken care of at \$AEA0-\$AEAD.

Fitting In The Code

Since the combined code for MREAD/MSAVE is just a bit too long to fit into any of the areas of memory within DOS 3.3 that are "free", I put the code at \$AE8E where the code for INIT normally lives. If you want, you can reassemble the code so that it will exist within two of the "free space" areas in DOS, \$B6B3-\$B6FD and \$BA69-\$BA95, for example.

Changes To DOS

Because of the addition of the two new DOS commands, there are some changes that must be made to DOS so that it will accept the new commands, locate the code that handles them and know what parameters (A, L, S, D, etc.) can be included with the command. There are 3 places these changes must be made:

- 1) The command handler entry point table at \$9D1E-\$9D55. This table contains the entry point of the code which handles each of the DOS commands. The addresses stored here are actually one less than the true entry points (see page 8-4 of Beneath Apple DOS).
- 2) The DOS command name text table at \$A884-\$A908. This table contains the ASCII code for each of the valid DOS commands. The code for the last character of each command must have its high bit set to 1 (see page 8-18 of Beneath Apple DOS).
- 3) The Command valid keywords table at \$A909-\$A940. This table contains a two byte entry for each of the DOS commands to indicate what keywords or parameters are legal for that command. Each of the sixteen bits within these 2 bytes has a certain meaning (see page 8-18 of Beneath Apple DOS).

To fit in the two new DOS commands, I had to remove two of the existing commands. INIT was an obvious choice to eliminate since its code is written over, anyway. The seldom used (for me, at least) CHAIN was the second command to go. All that is necessary is to replace the table entries for these two commands with what is needed for MREAD and MWRT. These changes are:

- 9D1E:9A AE - Address-1 of MWRT code.
- 9D26:8D AE - Address-1 of MREAD code.
- A884:4D 57 52 D4 - Text for MWRT.
- A893:4D 52 45 41 C4 - Text for MREAD
- A909:20 7B - Valid keywords for MWRT.
- A911:20 7B - Valid keywords for MREAD.

Fixing a ProDOS 1.0.1 BSAVE Bug

by Cecil Fretwell

For those of you who have ProDOS 1.0.1, dated 1 Jan 84 and BASIC.SYSTEM dated 15 Nov 84, are you aware of the fact that the BSAVE command has a bug if you use it with the B (byte) parameter? If you don't believe me, just read on.

The Bug

To demonstrate this bug, try the following test. First, create a new file using the following command

```
BSAVE TEST,AS1000,L256
```

The CATALOG command will correctly show the length of TEST to be 256 with a starting address of \$1000. Now type

```
BSAVE TEST,AS1000,L256,BS100
```

The CATALOG will now indicate that TEST has a length of 512 and a starting address of \$1000. So far, so good. Now, type

```
BSAVE TEST,AS1000,L256,BS200
```

A CATALOG will show that TEST has a length of 512 and a starting address of \$1000. If the ProDOS documentation is correct, the length of the file after the third BSAVE should have been 768.

Perhaps you think I used the parameters incorrectly. Should I have used an address of \$1100 in the second BSAVE and an address of \$1200 in the third BSAVE? You can give that a try if you like, but you will find the result to be the same. No matter what B, A or L parameters are specified, the third BSAVE will overwrite the effort of the second BSAVE.

Disclaimers

Now I will present a fix for this bug with the following disclaimers. First, this bug has been corrected in the latest release of ProDOS (1.1). Apple made several changes to the latest release of the BASIC.SYSTEM file, in addition to the correction of the

BSAVE bug. Because Apple feels that assembly language programmers should only access ProDOS through the Machine Language Interface (MLI), they have reserved the right to change code from release to release. The result will be that the code for the ProDOS commands will be shifted in memory. **Therefore, if you apply my patch for the bug, be forewarned that it will only work on the modules whose dates were given at the beginning of this article.** Secondly, although several of us have tested the patch, there is no guarantee that it will work perfectly under all conditions.

The Fix

If you do not want to permanently change your copy of BASIC.SYSTEM, on the ProDOS boot disk you can just write a short program which will apply the patch whenever it is run. This program will change the content of \$AF1C from \$30 to \$40 and the contents of \$AF1D from \$F0 to \$D0. Create this program and save it after booting up ProDOS by typing the following

```

NEW
10 POKE 44828,64 : POKE 44829,208
SAVE FIX.BSAVE.BUG

```

When you want to apply the patch just type

```
RUN FIX.BSAVE.BUG
```

Of course, you can also just perform the appropriate POKE's from immediate mode whenever you like.

To permanently apply the patch to a ProDOS System disk, type in the following commands

```

BLOAD BASIC.SYSTEM,TSYS,AS2000
POKE 44828,64:POKE 44829,208
UNLOCK BASIC.SYSTEM
BSAVE BASIC.SYSTEM,TSYS,
AS2000,L52000
LOCK BASIC.SYSTEM

```

The patch will now be active each time you boot the disk.

Convinced?

To convince yourself that the patch works,

let's try the original set of commands all over again. Type

```

DELETE TEST
BSAVE TEST,AS1000,L256
BSAVE TEST,AS1000,L256,BS100
BSAVE TEST,AS1000,L256,BS200
CATALOG

```

The CATALOG will now show that TEST has a length of 768, just as it should. You can now use the B parameter to "append" data to whatever file you want.

The above example is really not something you would normally want to do since the data at \$1000-\$10FF was not changed between the BSAVES. Let's try something a little more applicable.

Suppose you want the data in \$1000-\$1FFF, \$2000-\$20FF and \$3000-\$30FF stored, in that order, into a single file. The following commands will perform this task

```

BSAVE DATA,AS1000,L256
BSAVE DATA,AS2000,L256,BS100
BSAVE DATA,AS3000,L256,BS200

```

A CATALOG of the disk will show DATA to have a length of 768 with a starting address of \$3000. Take note of the starting address; it is the address from which the final BSAVE was performed. If you do not want to have the data BLOADed at \$3000 you will have to specify another address when you BLOAD DATA. For example, by typing

```
BLOAD DATA,AS1000
```

If you wish, you can also reset the load address to \$1000 by typing

```

BLOAD DATA,AS1000
BSAVE DATA,AS1000,L768

```

I hope that my fix for the ProDOS BSAVE bug will be of help to those users who have not yet obtained the latest release of ProDOS.

installed - IT WORKS!

Don Lancaster, one of the pioneers of the microcomputer industry and author of such books as the TTL, CMOS and Cheap Video Cookbooks, in the last few years has become one of most active champions of the Apple II user. Besides being an author and all-around guerrilla hardware guru, Don is the founder of a Thatcher, Arizona based company called Synergetics which sells items such as an absolute RESET kit for the Apple IIe and a toolkit for users of Appewriter IIe.

The second edition of *Enhancing Your Apple, Volume 1*, is the first of a planned series of books by Mr. Lancaster designed to help serious users of Apple II computers realize the full potential of their machines. The first edition of the book was released back in 1982, and the recently published second edition has been updated to include information on the Apple IIe and Franklin Ace computers. The book lists at \$15.95 and provides four hardware and four software enhancements which deal mainly with hi-res graphics. A disk containing all the programs listed in the book and a package of the necessary hardware is also available by filling in the order cards provided at the back of the book.

In the introduction of the book, Don very clearly states his philosophy when it comes to the Apple Computer, its use and the personal computer industry in general. Here are some excerpts taken from the book's Introduction:

"The Apple II is far more significant and it will have a vastly greater impact than such short term frivolities as the automobile and television-and, possibly, even more than the printed word itself."

"The garbage-to-good ratio of Apple software is skyrocketing. The quantity of truly astoundingly atrocious Apple software is now running at least a thousand times ahead of the useful and reasonable stuff. And it's getting worse."

"Garbage software is usually locked, so that the user cannot back up or modify the program to suit his own needs. It is usually slow and awkward to boot."

"The big thing about copy protection is that it doesn't. A year's effort by a crackerjack military cryptography team can usually be undone in fifteen minutes, between klingon zappings, by your average fourteen-year-old. And morality and economics aside, one fact stands out....undoing copy protection is fun!"

Not only is it fun, but cracking the uncopiable is about the most challenging and most rewarding thing that you can possibly do with your Apple. And, the things you learn along the way are exactly the skills that you will need to become a really great programmer. So, I guess we should all be thankful for the copy-protection fanatics

Enhancing Your Apple II

Volume 1, Second Edition by Don Lancaster

Reviewed By Martin Collamore

since they are giving us all this fascinating entertainment and superb training at an unbeatable price."

"...it is absolutely impossible to write a great program in BASIC. Pascal, of course, is so bad that it is beyond the pale. Great programs must execute either wholly or in part in machine language so that they can use Apple's resource to the utmost, at the fastest possible speed."

Agree with Don or not, no one is likely to accuse him of being mealy-mouthed when it comes to the Apple.

The Enhancements

The first enhancement is aimed at those who use the family color TV as a monitor. Instructions are provided for the construction of what Don calls a "glomper". Not a type of cookie monster, a "glomper" simply provides a means of quickly connecting your computer to the TV, eliminating the aluminum switchbox that came with the modulator (that thing that was supposed to stick to the back of your television, but only stayed in place for about 10 minutes). According to Don, "This changeover switch is totally useless. It doesn't even do what it is intended to do, since you can easily leave a built-in antenna in place and radiate your video all over everywhere." Anyway, the use of Don's "glomper" will keep your downstairs neighbors from banging on the ceiling every time you turn on your computer and you don't even have to open up your computer to install it.

The remainder of the hardware mods do require you to open your Apple and heat up your soldering iron. The mods are simple and, if done correctly, removable if warranty work is needed.

The second enhancement is a programmable color killer. What it does is to allow true black/white/gray in HIRES and mixed text and graphics screens without all that annoying color fringing. It is programmable and is turned off by a cold boot or RESET. A POKE from Basic or BIT from assembly language turns the circuit on or off.

Some warnings: It won't work with Rev. 0 Apples and you must have a color monitor or reasonable quality TV. Since Rev. 0 didn't have a color killer circuit in the first place, and this mod uses the existing color killer circuitry in newer Apples (it works only in the text mode as is), this mod won't work for the owners of ancient Apples. The mod should work with any moderate quality TV after some adjusting of color levels and a tweak of the color trim on the Apple motherboard. The mod may not work on what Don calls "very old, cheap or scungy" TV sets due to the manner in which they detect a color signal. Because the color killer modification utilizes AN1 on the game paddle port, there may be conflicts for owners of some peripherals, such as light pens. You'll have to read the text to see if this applies to you.

The field sync enhancement described in Chapter 4 provides the basis for what I think is the slickest of the hardware enhancements. This enhancement allows you to lock your software to the video timing so that such things as the flipping of soft switches or display pages can be done *during* the return trip of the video raster scan from the bottom of the screen to the top. The mod

CORE

is so simple that it has been added to the Apple //e's circuitry. Who knows where Apple graphics would be today if this mod had been standard from the beginning.

Here are just some of Lancaster's suggestions for its use: "mix and match display modes, both dynamically and 'on the fly' for splits or wipes in any direction, eliminate 90% of the parts and hassles needed for a fast and precision light pen or touch screen, smooth, glitch-free animation or gentle scrolling. Or 3-D graphics, text over color, hundreds of LORES colors. How about video wipes moving smoothly off the page to reveal a second hidden page, done in any direction, speed, or combination."

An excellent explanation of the Apple CPU and video timing is presented as background to the field sync mod. Several short subroutines and demo programs are included on the disk and in the book. Those without the disk may have to relocate some programs, but it is not much of a problem. This modification does utilize the cassette port circuitry, but a switch can be added if you still occasionally use your cassette port for other I/O purposes.

The power of the field sync modification is demonstrated in Chapter 5 entitled, "Fun With Mixed Fields". Here, Don provides some software that allows you to mix Text, Lo-Res and Hi-Res in any display. Two well-documented programs are provided in this chapter to demonstrate the potential of "mixed fields". Apple //e owners can use the programs without having to pay homage to the god of hardware since the field sync modification is already built into their machines.

On Rev. 1 and newer Apples]['s there can be a glitch flipping in and out of LORES when using the field sync mod. In Chapter 6, Lancaster offers a fix for this glitch which requires modification of two chips on the Apple's motherboard. Again, for //e owners, this modification is not required.

The enhancements for Chapters 8 & 9 involve software only. Chapter 7's Gentle Scroll can be interfaced to Apple's Hi-Res Character Generator (or any other character generator) so that the text will scroll one, instead of eight, pixels at a time. If you have ever seen the standard HRCG scroll you will really appreciate this enhancement. The fast background utility in Chapter 8 provides a means of quickly clearing a hi-res page to your choice of 32 different colors or a practically infinite number of patterns. A complete discussion of the inner workings of the Apple's hi-res display is also included in Chapter 8.

The Tearing Method

One other area that is covered is more of a technique than an "enhancement". This is what Don calls the "Machine Language Tearing Method" and is detailed in Chapter 3.

Step by step, Lancaster shows you how to

break down someone else's machine language program into understandable subunits. The High Resolution Character Generator program on Apple's DOS Toolkit is used as an example, although the method will work just as well on any machine language program. After working the example, you're ready to try exploring for those extra ships or learning how to modify the printer driver in your word processor.

Although much faster and saner than some orthodox methods, one stated requirement is "The Right Attitude" so that you can "Grok The Program". This is especially true if this is your first attack in this field of battle. By working through the example you'll have picked up considerable assembly code experience, become familiar with the Apple's memory structure, and even gotten a good idea of how a machine language program is put together.

Some of the items you'll need to practice the tearing method are 48K with on board old monitor ROM (preferred, but not essential), printer, and 6502 and Apple references. Also, sundry stationary things like tape, scratch pads, and all the different color highlighters with matching felt-tip pens you can get.

I won't get into the nuts and bolts of the technique, but should you take the plunge and maintain your sense of proportion and perspective, you'll be amply rewarded for your time. Needless to say these techniques might be used to study protection schemes.

Conclusions

Don Lancaster has provided plenty of grist for the graphics-oriented mill. HIRES hackers should run, not walk, to get a copy of "Enhancing Your Apple][" Vol. 1. Since Apple has provided the field sync mod on the //e, you can now program for an audience wider than your own customized machine.

If you are considering ripping into someone else's machine code, Lancaster's clear instructions on how to do this are excellent. Like cod liver oil, it is sometimes difficult to take, but it does you some good. His techniques are a world above brute force methods. Joe "shoot'em-up-Zaxxon" Jones might find these things interesting, but the enhancements aren't really directed toward him.

If you buy the book, consider buying the hardware package unless you have access to a well-stocked electronics store that carries machined-pin DIP sockets. Don't cut corners! Follow instructions! The insulation you smell may be your own!

Volume 2 of Enhancing Your Apple is apparently very close to publication. The promised enhancements include an absolute RESET modification for the Apple //e, a graphics screen dump program for daisy wheel printers and a \$2 BSR ultrasonic interface. Personally, I can't wait.

Locksmith 5.0

And The Locksmith Programming Language

By Thomas H. Dragon

When the bit copy program Locksmith first became available from Omega in 1981, it could not be purchased in most computer stores. It was a revolutionary program that only hackers dared dream of and most stores were afraid to carry. I purchased my Locksmith, one of the first 600, directly from Omega. Of course, as commercial companies learned about Locksmith, their protection procedures became more and more sophisticated. Omega then began a series of Locksmith updates to accommodate the new protection procedures. Each update of Locksmith was more powerful than the previous update. By the time Locksmith 4.0-4.1 became available, it was necessary to make parameter changes for virtually every disk on the market. But it is only possible to update a fundamental algorithm so many times before it becomes necessary to change the algorithm altogether.

Locksmith 5.0 represents a long awaited change in the fundamental Locksmith algorithm. Like the first Locksmith, this new version is also revolutionary, both in method of operation and in philosophy of user support.

Omega Microware: 1981-1984 R.I.P

Omega Microware Inc. the original publisher of Locksmith and the Locksmith family, Inspector and Watson, filed for bankruptcy in June 1984. The Locksmith family is now supported by Alpha Logic Business Systems Inc. of Woodstock, IL. Rumor has it that Omega went bankrupt with debts totaling one-quarter of a million dollars. An interesting sideline to this story is that for some period of time prior to their demise, Omega entered into the disk protection business. If this cannot be considered a conflict of interest, I do not know what can be. Perhaps this could help explain why Omega's support for Locksmith became so dismally poor.

Alpha Logic, the new support company for Locksmith, is not a new company. They have been in the distribution business for several years, dealing especially with Saturn products. They intend to provide full support for the Locksmith family of products and have hired the Locksmith development team. They are providing full research and development support for Locksmith and related Locksmith products, such as Locksmith for the //e and a "Locksmith" type algorithm for the Macintosh and the IBM-PC. They are supporting a quarterly newsletter that provides both in-depth and simple

information about Locksmith and new ways of using it. This newsletter is available for \$12 to registered Locksmith owners. Furthermore, Alpha Logic is providing exceptional telephone support and has already implemented some innovative Locksmith support techniques.

Locksmith Programming Language (LPL)

The new concept associated with Locksmith 5.0 is the Locksmith Programming Language, LPL. At first glance LPL is somewhat overwhelming! It is a label language similar in style to LOGO. The 140 page user's manual, in conjunction with the first Locksmith Newsletter, provides a great deal of insight into the role and function of LPL. I have listed two LPL "programs" in Table 1. Each line represents a logical operation. Each language label has an algorithm associated with it. For example, algorithm #7B

is referred to as READ in the label language. The Locksmith manual provides a reasonable description of these labels. For the label READ the following description is given:

"This algorithm reads a track. If it encounters an error, it checks to make sure that the number of times the track has been read is less than the value in REREAD. If so, it activates ACTREAD, clears all error flags and rereads the track. If the value is equal to or greater than REREAD, it exits with the appropriate error flag set."

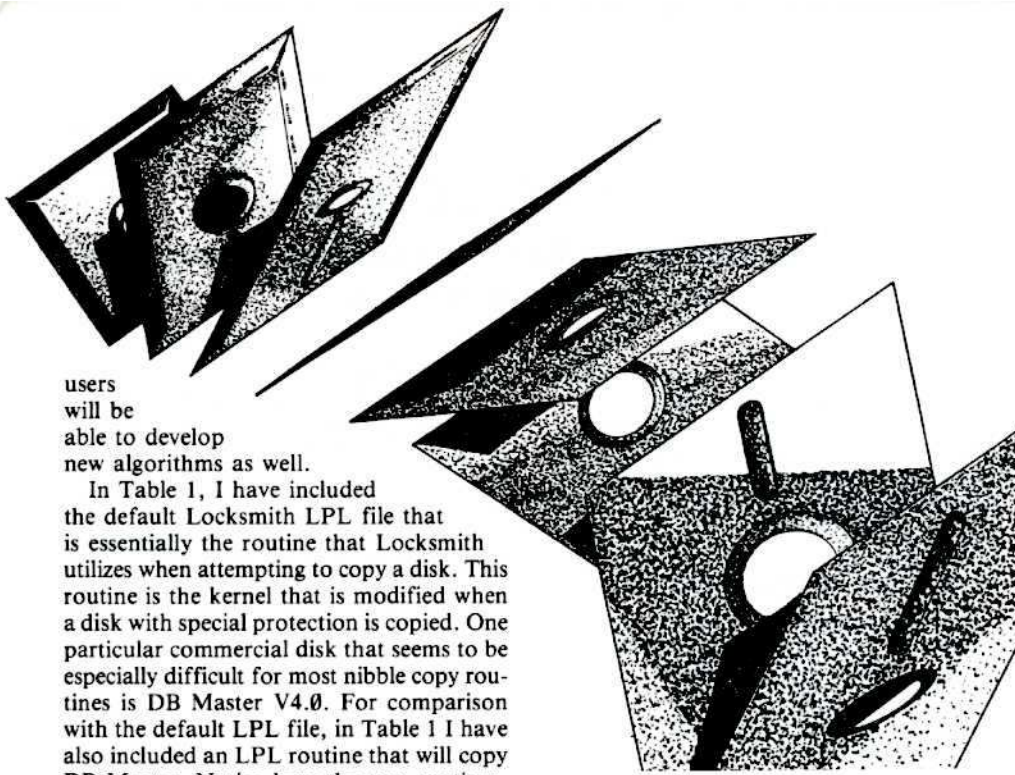

The Locksmith authors feel that LPL is much more flexible than the old numerical parameter approach, as words are more meaningful and easier to work with than numbers. They feel that they will be able to develop new algorithms as the need arises. Furthermore, they hope that some of the

users will be able to develop new algorithms as well.

In Table 1, I have included the default Locksmith LPL file that is essentially the routine that Locksmith utilizes when attempting to copy a disk. This routine is the kernel that is modified when a disk with special protection is copied. One particular commercial disk that seems to be especially difficult for most nibble copy routines is DB Master V4.0. For comparison with the default LPL file, in Table 1 I have also included an LPL routine that will copy DB Master. Notice how the two routines, Default and DB Master, are virtually identical except for the last lines, the COPY statements.

Utilizing An LPL Routine To Copy A Disk

There are at least three ways to copy DB Master with Locksmith 5.0. From the boot-up Locksmith menu the Text Editor may be entered by pressing T. Once in the Text Editor you may enter the LPL routine for DB Master to form an LPL file. This is accomplished after pressing E (enter editor) while in the Text Editor. Once entered, the LPL routine may be saved as an LPL file by pressing S. The file may be saved on either the Locksmith disk or on some other DOS 3.3 disk. Once the LPL routine has been entered, simply press B (backup/copy disk) and follow the screen instructions to obtain a backup of DB Master.

A second, much easier, method for backing up DB Master involves the use of a Parm Disk that comes out quarterly with the Locksmith Newsletter. The Parm Disk has an extensive collection of LPL files arranged in alphabetical order. The information in Table 1 came from the Parm Disk. To use the Parm disk, enter the Text Editor. Once in the Text Editor, press the letter L (load LPL file). When prompted for the parm file name, enter PARMS D for DB Master inasmuch as there is one parm file for each letter of the alphabet and the first letter of the program identifies the particular parm file to be used. The user will be prompted again to enter the actual name of the program, DB MASTER V4.0 for this example. Locksmith then searches for the PARM D file and searches within the PARM D for the DB MASTER V4.0 LPL file. Once the file is loaded (approximately six seconds), press the letter B (backup/copy) and follow

screen prompts to make the backup.

The third procedure is similar to the old parm's procedure followed with the Locksmith 4.0 series whereby numerical parameters are entered. To enter parameters, the letter P (parameter) must be pressed from the boot-up menu. Most of the old parms appear to work with Locksmith 5.0 but there are no numerical parms available, at present, for newer commercial programs, only LPL files. However, the Locksmith authors are contemplating making available the parm equivalents of LPL files.

Interestingly, many of the LPL files are very basic modifications of the default LPL file provided in Table 1. The file for DB Master is no exception. It is simply the default LPL file with additional lines appended in place of the COPY 0 22 1. If you have used earlier versions of Locksmith, it is clear from the appended code that DB Master uses track synchronization, that tracks 0 to 5 are copied using increments of 1 and then half tracks are used in increments of 1 from 6.5 to 22.5. Note that a second set of COPY statements is included; the asterisks denote comment-type labels. Some of the newer versions of DB Master use a spiral tracking procedure for protection. If the first LPL file does not provide a faithful copy and your DB Master is protected with spiral tracking, changing the COPY statements as noted at the bottom of Table 1 should provide a faithful copy. Be sure to remove the asterisks from the front of the copy statements.

LPL Files In General

It should be clear that loading an LPL file from disk is a very straightforward and relatively error free method for customizing Locksmith to backup a specific disk. It should also be apparent that the LPL

language makes Locksmith much more powerful and generally useful than any other nibble copier. The first Parm Disk (discussed in the first Locksmith Newsletter) is available from Alpha Logic for \$8 and is a real bargain inasmuch as it contains LPL files for approximately 200 commercial disks. I compared the Hardcore Most Wanted List (Issue No.10) with the first Parms Disk and found LPL files for the following commercial disks: APPLE Business Graphics, Flight Simulator II, Type Attack, DB Master V4.0, PFS Graph, and Facemaker.

It would appear that there will be two types of users for Locksmith 5.0: the user who not only backs up disks but also develops new LPL files, and the user who is simply interested in backing up disks and has neither interest nor skill in developing new LPL files. Alpha Logic has indicated that they will purchase and publish in their newsletter the new LPL files from those who make them. This is the Locksmith parm-developer incentive plan. This new symbiotic support relationship should work very well for the user community.

New Locksmith Features

Locksmith 5.0 is on a DOS 3.3 disk which means that it will boot on any APPLE compatible drive, unlike other nibble copiers (EDD) which do not boot on some APPLE drives. The Parms Disk is also on a DOS 3.3 disk. This allows the actual creation of parm files with either the Locksmith Text Editor or any one of a number of word processors. Finally, placing programs and files on DOS 3.3 disks reduces the per-disk reproduction costs.

There are several features built into Locksmith 5.0 that are not yet available to the general user. Perhaps the most interesting aspect of this new Locksmith is an unprotect feature. For the disk with copy protection that appears to be impossible to backup because of physical alteration of the disk itself, Locksmith has an undocumented feature that can ultimately produce an un-protected copy! I have not actually seen this feature work and methods for making it work have not yet been provided to the general population of users, but the necessary algorithms are already in Locksmith 5.0.

DOS 3.3 Utilities

The 16 sector utilities on the new Locksmith are quite exceptional! There are five general utilities: fast (very fast!) backup, fast verify, sector format, sector compare, and sector sync signature. These utilities are intended to work with regular unprotected DOS 3.3 disks. The backup and verify are unbelievably fast and take advantage of any memory expansion card(s) that you might have in your APPLE. With a Saturn 32K card I am able to copy a DOS 3.3 disk in approximately 12 seconds. In my opinion, the integrity of this copy routine is better than that of any of the quick-copy procedures.

That is, you actually know when repeated reads or writes are made for a particular sector and whether or not the repeat was successful. Using the sector compare, two disks may be rapidly compared sector by sector to specifically identify by sector any differences that may exist between the two. The sector format utility allows the user to re-format either a sector, track or whole disk. The sync signature allows you to study the synchronization scheme on a disk as well as determining what copy program created a 16 sector disk! The sync signature is discussed in detail in the user's manual.

The more general utilities found on previous Locksmith versions are still available on Locksmith 5.0. These are: erase a disk, certify a disk, and disk speed check. Furthermore, there are several new general utilities: a parameter editor which allows a user to scan and modify all Locksmith parameters; a quickscan that scans a disk to determine to determine which tracks on a protected disk are and are not being used; and a screen print routine working with a single key-stroke. Of course, the Watson and Inspector interface is still supported.

Support And Updates

It is already quite clear that Alpha Logic intends to provide better support than Omega did. However, support will only be provided for registered users. If you are not a registered user you will not receive telephone support and you will not be eligible to receive the Locksmith Newsletter or the Parm's Disk. When you place a support call to Alpha Logic you will be asked for your Locksmith serial number, your name and a bit of random information from your registration card, such as zip code or street number. If you cannot provide the necessary information then you will not receive support help. Alpha Logic will not be giving out parameters over the phone, but will try to develop LPL files for those programs for which there is the most demand. These files will be distributed through the newsletter and the parms disk.

Disk updates are easily accomplished through the newsletter or Parm's Disk. If the Parm's Disk is to be used, enter the Text Editor, press L for load, and respond to the prompt with the word PATCH. An update patch is loaded. Once the patch is loaded press P (patch) in the Text Editor and, if the prompts are properly followed, the Locksmith disk is updated to the current version level. The first parms disk contains the patch to early revisions up to the latest revision, F. Beware if you have a liberated Locksmith disk. It appears that it will be destroyed by the patch update.

When purchasing or updating to Locksmith 5.0 the customer is provided with an original and a backup. Replacement disks are available for \$5 and an original. This policy is a bit better than the original Omega policy which did not provide a backup with the original. Alpha Logic has indicated that it will not provide LPL files for, or any information regarding, the backup of those commercial disks that provide at least two backups or backups for \$5 or less.

The more I use my Locksmith 5.0 the more I like it, especially its 16 sector utilities. I am more than pleased with the ease of use of the Parm's Disk. At this time, I would recommend Locksmith 5.0 over any other nibble copier.

WHIZ KID By Ray Darrah

In Hardcore COMPUTIST No.10, I discussed the encoding technique DOS uses to make up for the hardware weakness of not being able to read certain bytes from the diskette reliably. That technique is called "6 and 2" encoding because six bits of the original byte are put one place and the other two are placed in a different byte. Older versions of DOS use different encoding techniques. For example, because DOS 3.2's hardware was inferior to DOS 3.3, even less "valid bytes" were possible. Therefore, "5 and 3" encoding was used. This resulted in a nibblized sector occupying 410 bytes instead of the 342 bytes that a nibblized DOS 3.3 sector occupies. Since a sector can be more efficiently nibblized with DOS 3.3, more of them can be stored per track (16 as opposed to 13).

There is an encoding technique used by both versions of DOS called "4 and 4" encoding. In this technique, the even bits of a byte are stored in one byte and the odd bits are stored in the other. The bits from the original bytes (both even and odd) are stored in the even bits of the output bytes. The output bytes are ORED with \$AA which has the effect of turning all the odd bits to 1. This makes the output bytes meet the requirements of the disk head. The MSB is a one and no two consecutive zeros will result. To illustrate this, here are some sample input and output bytes:

Original	Nibblized	
00000000	10101010	10101010
11111111	11111111	11111111
10101010	11111111	10101010
01010101	10101010	11111111
11011001	11101110	11110011
ABCDEFGH	1A1C1E1G	1B1D1F1H

Because each original byte yields two nibblized ones, a sector encoded with "4 and 4" encoding would occupy 512 bytes. If a DOS were to encode its sectors with this technique, it could only fit 10 or 11 sectors per track. This is why neither DOS uses this technique to encode an entire sector.

What Is It Used For?

In Hardcore COMPUTIST No.8, I mentioned the address marks and data marks on the diskette. I also mentioned that in the address field there are a string of bytes that tell DOS various things about the sector that is about to pass under the read/write head. In fact they are eight bytes that, when decoded in a "4 and 4" manner, produce the disk volume, track number, sector number and checksum for the first three. The checksum byte is made by Exclusive ORing (EOR) the first three bytes together. An Exclusive OR is just like an OR (if a bit of either byte is 1, then the corresponding output bit will be 1) except if both bits are 1, then the corresponding output bit will be 0. This has the effect of toggling certain bits.

Why Use That Kind Of Encoding?

The reason DOS uses "4 and 4" encoding is because the algorithm to convert nibblized bytes into their original values is extremely simple. Because of this simplicity, DOS can read and convert the bytes at the same time. This makes it possible for DOS to read these bytes, make sure the checksum and track number are correct and decide whether the sector following is the right one all before the data field comes below the head.

If any of these eight bytes aren't what they are supposed to be, then normal DOS will not read the sector that follows them. The Address field is written during INITIALization, and never again.

ATTENTION ADVENTURERS!

Adventure Data Base

Hardcore COMPUTIST is looking for more adventure hints to any of the popular adventure/fantasy games sold for the Apple II, II Plus or //e. These will be used in our regular column, ADVENTURE TIPS.

Your Clues, Please

We prefer that these hints not be dead giveaway solutions to dilemmas presented by the particular game, but instead contain just enough information to nudge the stumped adventurer towards the solution to his/her problem.

How & Where

So, if you know how to open the jewel-encrusted egg, how to plug the hole in the rowboat, where to find the key to the treasure chest, or any other tidbits of information that may be helpful to your fellow traveler, please send this information on a 3x5 postcard to:

Hardcore COMPUTIST
Attention: Adventure Tips

Tacoma, WA 98444

P.S. Please don't forget to include the name of the adventure game to which your hint pertains and the name of the manufacturer.

ADVENTURE TIPS

Deprotecting Electronic Arts

By Pete Levinthal

Requirements:

48K Apple][,][+, //e with at least one DOS 3.3 disk drive
Super IOB
A sector editor
A blank disk
Cut and Paste, The Last Gladiator, or One on One from Electronic Arts

Electronic Arts' recent releases have all used very nearly the same protection. Their protection scheme has been to change the data field prologue bytes from a normal "D5 AA AD" to a modified "D5 BB CF" on tracks \$03 to \$20. Tracks \$00 to \$02 contain the modified RWTS to read the new data field bytes and hi-res title page. These three tracks are unprotected normal DOS 3.3. In addition, these recent releases have a nibble count on track \$22, and track \$21 is unused.

Remember that the prologue data field bytes tell DOS where the data starts on a sector. This is usually identified by the unique sequence of bytes "D5 AA AD". Electronic Arts has modified these to "D5 BB CF" so normal DOS cannot tell where the data starts and hence, an I/O error occurs when copying with COPYA (or some bit copiers for that matter).

So, to deprotect the new Electronic Arts releases we must:

- 1) Read the original disk with data field prologue bytes of "D5 BB CF".
- 2) Write to a normal DOS 3.3 disk with normal data field prologue bytes of "D5 AA AD".
- 3) Change the modified Electronic Arts' RWTS to read normal "D5 AA AD" data field prologue bytes.
- 4) Disable the nibble count.

Easy enough, right? We can use Super IOB to do most of the work and then use a sector editor to complete the process. Here is the procedure:

- 1) Enter the Super IOB controller at the end of this article and save it as EOA.CON.
- 2) With the Electronic Arts controller installed, run Super IOB.

What Happened?

When Super IOB is finished, it will have made these sector alterations:

Track	Sector	Byte	From	To
01	0F	68	20	18
01	0F	69	A2	60
01	0F	6A	A1	EB
02	03	47	BB	AA
02	03	51	CF	AD

If you have copied Cut and Paste, then that's all. Enjoy your backup. If you have copied The Last Gladiator or One on One, then you will need to pull out your sector

editor and make the following modifications (to the copied COPYAable disk):

The Last Gladiator

Track	Sector	Byte	From	To
1F	0E	05	A0	18
1F	0E	06	20	60
1F	0E	68	20	18
1F	0E	69	A2	60
1F	0F	05	A0	18
1F	0F	06	20	60
1F	0F	68	20	18
1F	0F	69	A2	60

One On One

Track	Sector	Byte	From	To
09	02	1F	01	FD
0C	04	05	A0	18
0C	04	06	18	60
0C	04	07	88	C8
0C	04	DC	A0	18
0C	04	DD	FF	60

Now you're all done! Don't forget to write the sectors back out to your COPYAable copy as you change them.

Know where your head is, at all times, with TRAK STAR constant digital readout

- Saves copying time
- For nibble programs

- + Works with nibble copy programs to display tracks and half-tracks that the program accesses.
- + Operates with any Apple®-compatible program.
- + Save time by copying only the tracks being used.
- + Displays up to 80 tracks and half-tracks, compatible with high density drives.
- + If copied program doesn't run, Trak Star displays track to be re-copied.
- + Compact size permits placement on top of disk drive.
- + Does not use a slot in the Apple® computer.
- + For Apple® II, II+ and IIe

Apple is a registered trademark of Apple Computer Inc.

BACK UP YOUR DISKS

NOW AVAILABLE
AT YOUR LOCAL
COMPUTER STORE!

\$79⁹⁵

EDD runs on Apple II, II plus (including most compatibles), IIe, and III (in emulation mode), with one or two 3.5 disk drives.

EDD is the most powerful copy program available for backing up your protected Apple software. Since EDD has been preset to copy a broad range of copy-protections, many disks can be copied easily, without changing messy parameters. Even though you rarely need to change them, each parameter is fully described in the operating manual. Unlike the copycards, which only copy single load programs, EDD backs up entire disks. Thus, not only copying single load, but, multi disk access programs as well. We feel on an average, EDD can back up many more protected disks than all other copy programs or copycards put together.

ESSENTIAL DATA DUPLICATOR III™

- Automatically copies most protections.
- Rarely needs parameter changing
- Average duplication time 2½ minutes
- Accurately finds "self-sync" bytes and their lengths
- Can copy ¼ and ¾ tracks
- Updated program lists available
- Unlike copycards, EDD backs up entire disks, not just what's in memory

To order direct; send \$79.95 plus \$2 shipping (\$5 foreign), California residents add 6%. Mastercard/Visa accepted. Prepayment required.

..... News Of Note

Chapter 7 Blues

If you have been wondering what happened to your September 1984 edition of *Softalk* magazine, you might be interested to know that, according to the September 17th issue of *InfoWorld*, Softalk Publications Inc. filed for bankruptcy under Chapter 7 of the bankruptcy laws on August 22nd. Going down with the Softalk Publication ship are *Softalk* (Apple), *Softalk for the IBM Personal Computer* and *St. Mac* (MacIntosh). Earlier in the year, Softalk Inc. had ceased publication of *St. Game* (originally *Softline*).

Although we do not have any particular insights into why Softalk Publications should have come to such an untimely end, the number of pages in *Softalk* for the Apple had clearly been decreasing over their last several issues mainly due to diminished advertising. The accompanying drop in revenues probably dealt a fatal blow to *Softalk*. This sort of pinch has already affected a number of other industry publications which rely heavily upon advertising income.

Other computer-related magazines which will cease (or have already ceased) publication in 1984 include *Color Computer* (TRS-80 Color Computer), *PC, PC Jr.*, just plain *Jr.*, *CAP* (Computers Accessories and Peripherals), *Personal Software*, *Microcomputing* (originally *Kilobaud Microcomputing*), *Commander* (Commadore computers) and *Whole Earth Software Review* (to be merged with *Co-Evolution Quarterly*).

As *Whole Earth Software Review's* publisher, Stewart Brand said, 'It's a bloodbath out there, isn't it?'

**WHO
LIKES
THE
CIA ?**

HERE ARE JUST A FEW OF THE MANY

"an essential part of the Apple-user's repertoire" - APPLE USER

"a valuable buy ... manual is practically worth having on its own" - WASHINGTON APPLE PI

"the folks at Golden Delicious should be commended ... worth waiting for" - HARDCORE COMPUTIST

"multifaceted" - NIBBLE

"the most comprehensive disk accessor I have ever come across" - A.B., VERNON, CANADA

"its ability to unlock other programs will greatly help me" - DR. B.P., SAN FRANCISCO, CALIFORNIA

"an excellent set of programs ... just great - and good value too" - E.A.S., MILTON KEYNES, ENGLAND

"very, very educational ... great manual ... it is FANTASTIC!!!!!!" - J.C., TUCSON, ARIZONA

"a very enlightening piece of software/book ... top of my list for good buys" - H.S., BLAINE, MINNESOTA

"I like yours the BEST" - R.R., CHICAGO

Why all the excitement about the CIA (confidential information advisors)? Probably because it is the ONLY set of utilities (5 in all) which enable even a beginner to investigate, edit, locate, list, trace, rescue, translate, patch, repair, verify, examine, protect, unprotect, analyse, encrypt, and decrypt programs on normal AND protected disks. You also get the "CIA Files", a 65000+ word book which contains detailed instructions for using the CIA plus easy-to-follow, hand-holding tutorials about patching, repair, formatting, encoding, protection, and numerous other disk topics. You'll find plenty of material here which has never before appeared in print. PROGRAMS NOT COPY PROTECTED.

To put the 5 CIA utilities, plus book, on the trail of your Apple II+/Ile (R) disks, send \$65.00 by check or money order to:

Having problems with retrieval?

You need software insurance.

Diskettes are fragile, and when a protected program is damaged, the results are expensive and inconvenient. If you have a backup diskette, though, you can have your Apple, IBM or compatible computer back on line within seconds... affordably. That's software insurance.

Copy II Plus (Apple][,][Plus, IIe)

This is the most widely used backup program for the Apple. Rated as "one of the best software buys of the year" by InCider magazine, its simple menu puts nearly every disk command at your fingertips. The manual, with more than 70 pages, describes protection schemes, and our **Backup Book™** lists simple instructions for backing up over 300 popular programs. A new version is now available that is easier to use and more powerful than before. Best of all, Copy II Plus is still only \$39.95.

WildCard 2 (Apple][,][Plus, IIe)

Designed by us and produced by Eastside Software, WildCard 2 is the easiest-to-use, most reliable card available. Making backups of your total load software can be as easy as pressing the button, inserting a blank disk and hitting the return key twice. WildCard 2 copies 48K, 64K and 128K software, and, unlike other cards, is always ready to go. No preloading software into the card or special, preformatted diskettes are required. Your backups can be run with or without the card in place and can be transferred to hard disks. \$139.95 complete.

Important Notice: These products are provided for the purpose of enabling you to make archival copies only. Under the Copyright Law, you, as the owner of a computer program, are entitled to make a new copy for archival purposes only, and these products will enable you to do so.

These products are supplied for no other purpose and you are not permitted to utilize them for any use, other than that specified.

Copy II PC (IBM)

This is **THE** disk backup program for the IBM PC and PC/XT that backs up almost anything. Others may make similar claims, but in reality, nothing out performs Copy II PC... at any price. Copy II PC even includes a disk speed check and is another "best buy" at only \$39.95.

We are the backup professionals. Instead of diluting our efforts in creating a wide variety of programs, we specialize in offering the very best in backup products. So, protect your software investment, **before** your software meets its master.

CENTRAL POINT Software, Inc.

The Backup Professionals

To order, call 503/244-5782, 8:00-5:30 Mon.-Fri., or send your order to: Central Point Software, 9700 SW Capitol Hwy, Suite 100, Portland, OR 97219. **Prepayment is required.** Please include \$3 for shipping and handling (\$8 outside U.S. or Canada).   Welcome
