FALL 1981

\$3.50

The Apple Nobody Knows
Tasting an Apple
Price War

SUP'R'FAN

- Fits inside the APPLE II case
- Powered by 117VAC and does not depend on the Apple Power Supply
- Brushless AC Motor for no electrical noise
- Does not interfere with all present Apple Peripherals
- Mounts with one screw—no drilling required
- Will not interfere with magnetic media such as metal cased monitors or disks in close proximity (less than 1/2 gauss)
- Lowers IC surface temperatures
- Weighs only 18 oz.

SUP'R'TERMINAL

- 80 Columns by 24 lines, upper and lower case; all 128 ASCII characters
- Includes an Upper and Lower case 5x8 dot matrix ASCII character set, and inverse alpha characters
- Character set can be user definable
- Shift Lock feature
- Works with APPLE PASCAL and APPLE BASIC
- Compatible with ALL APPLE II peripherals
- CP/M Output cursor*
- Pascal 1.1 Keypress and type ahead in firmware*
- 3K bytes of bank switched static ram
- 2K bytes of ROM
- The only board with continuous direct memory mapped screened ram
- The only board that interprets VTABS by firmware (version 2.2)
- The only board with an adjustable scrolling window
- The only 80 column board that is synchronous with the APPLE II
- Fully programmable cursor
- Works with CORVUS and NESTAR Systems

*Version 2.5

APPLE II is a trademark of APPLE Computer Co.
CP/M is a trademark of Digital Research

SUP'R'SWITCHER

- 90 to 135 VAC/60Hz or 180 to 270 VAC/50Hz input
- Fully protected — voltage/current
- Overvoltage protection
- 0-50 C full load operating temperature
- Output voltage current
 - +5V @ 6A -12V @ 1A
 - +12V @ 1A -5V @ 1A
- Weight—2 3/4 lbs
- Size 3 3/4" H 9 3/4" D 6 1/4" W
- Mounts on left side of Apple II
- Sufficient current to handle all 8 slots
- Plugs directly into the Apple II motherboard

SUP'R'MOD II

The SUP'R'MOD II is a wide band black and white or color compatible interface system intended to convert the home TV to a full video display for home computers, CCTV cameras and similar systems which output NTSC compatible composite video. The SUP'R'MOD II is pre-tuned to U.S. channel 33 (UHF), includes a coaxial cable and antenna transformer, and in conjunction with a standard home TV set, insures safe isolation and high performance.

SYMBOL	DESCRIPTION	TYPICAL	UNIT
F_c	Vision Carrier	591.5	MHz \pm 0.5
I_{cc}	Supply Current	2.0	Ma
VO (Hi)	RF Output, $V_{mod} = 0$	1.5	Mv
VO (Low)	RF Output, $V_{mod} = 1.5$	-20.0	dB
$R_{in(mod)}$	Modulation input resistance	700.0	Ohm
$V_{osc(Min)}$	Oscillator stop voltage	2.0	Volt
V_c	Voltage	+5 to +12	Volts DC

Turn your Apple into the world's most versatile personal computer.

The SoftCard™ Solution. SoftCard turns your Apple into two computers. A Z-80 and a 6502. By adding a Z-80 microprocessor and CP/M to your Apple, SoftCard turns your Apple into a CP/M based machine. That means you can access the single largest body of microcomputer software in existence. Two computers in one. And, the advantages of both.

Plug and go. The SoftCard system starts with a Z-80 based circuit card. Just plug it into any slot (except O) of your Apple. No modifications required. SoftCard supports most of your Apple peripherals, and, in 6502-mode, your Apple is still your Apple.

CP/M for your Apple. You get CP/M on disk with the SoftCard package. It's a powerful and simple-to-use operating system. It supports more software than any other microcomputer operating system. And that's the key to the versatility of the SoftCard/Apple.

BASIC included. A powerful tool, BASIC-80 is included in the SoftCard package. Running under CP/M, ANSI Standard BASIC-80 is the most powerful microcomputer BASIC available. It includes extensive disk I/O statements, error trapping, integer variables, 16-digit precision, extensive EDIT commands and string functions, high and low-res Apple graphics, PRINT USING, CHAIN and COMMON, plus many additional commands. And, it's a BASIC you can compile with Microsoft's BASIC Compiler.

More languages. With SoftCard and CP/M, you can add Microsoft's ANSI Standard COBOL, and FORTRAN, or

Basic Compiler and Assembly Language Development System. All, more powerful tools for your Apple.

Seeing is believing. See the SoftCard in operation at your Microsoft or Apple dealer. We think you'll agree that the SoftCard turns your Apple into the world's most versatile personal computer.

Complete information? It's at your dealer's now. Or, we'll send it to you and include a dealer list. Write us. Call us. Or, circle the reader service card number below.

MICRO-SCI SQUEEZES MORE OUT OF YOUR COMPUTER, NOT YOUR POCKET

If you own an Apple II,* or plan to buy one, consider this:

The Disk II* subsystem made for your Apple II provides only 35 tracks of storage. But Micro-Sci subsystems made for your Apple II provide up to 70 tracks, without reduced versatility or compatibility.

MORE CAPACITY FOR LESS MONEY

Our A40 system features 40 tracks, whereas our A70 provides 70 tracks and exactly twice the byte capacity of Disk II.

With either Micro-Sci system, you pay a lot less per byte. And with the A40, you could even end up paying considerably less per drive.

COMPATIBILITY TO SPARE

Micro-Sci has achieved this extra storage while maintaining compatibility with your existing Apple formatted diskettes.

Our subsystems operate with DOS 3.2 and 3.3, Pascal, and the Z80 SoftCard.

VERSATILITY PLUS

You can even mix Apple Disk II's, A40's and A70's on the same computer. Micro-Sci's controller supports one or two A40's, one or two A70's or one of each.

Single or dual A40 drive subsystems give you more capacity (20,000 to 40,000 bytes) than Disk II drives, for less money.

Micro-Sci's A40/A70 subsystem combines the diskette level compatibility and interchangeability of the A40 with the superior storage capacity of the A70.

Dual A70's provide over half-a-megabyte of storage, at 5¼" floppy prices!

No matter which Micro-Sci subsystem you choose, you'll have more capacity, compatibility and versatility for your computer—and more money in your pocket. Contact us today for more information and the name of your nearest Micro-Sci Dealer.

ODYSSEY:

The Compleat Adventure

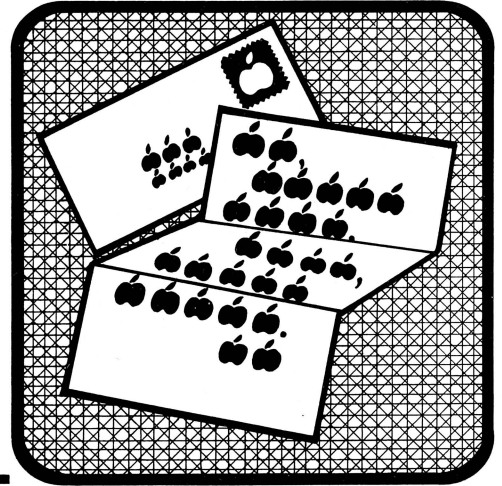

**Synergistic
Software**

5221 120th Ave. S.E.
Bellevue, Washington 98006

A colorful high-res graphics adventure on land and at sea, in dungeons and castles; different each time you play. Plan your strategy, solve the puzzles, and survive the endless variety of hazards and foes to reap your rewards. Odyssey is an ever fresh mythic adventure.
Apple II, DOS 3.2 or 3.3, Integer — \$30.00.

Letters to the Editor

Sir:

Enclosed is my check for a one-year subscription. I found the article "Comparing Applesoft Programs for Differences" in the Spring 1981 Orchard to be very helpful, and well-written. It's a pleasure to see a program that not only does the job, but does it with style.

In the same issue, the article "Screen Formatting of Text" (which, in general, is very good), the program for printing more than two columns does not work. The only time a "1" should be added is when the number of columns does not evenly divide the number of items. Perhaps the author meant to use the INTeger function. Also, the program should stop after item RN has been printed.

Francis A. Greene
Hedgesville, WV

(The INT function was intended, and was lost somewhere.

—Ed.)

Sir:

On Page 87 of the summer Apple Orchard is a question about weird numbers with the Applesoft Renumber. Because this kind of thing had been happening to me, I breathlessly turned the page for the rest of the answer . . . and no answer. Is there a "fix"? Or were you just kidding?

R. E. Johnson
Houston

There is a fix, no kidding. Here it is (I hope . . .)—PCW

AFTER USING THE RENUMBER PROGRAM, I GET SOME WEIRD CALCULATIONS. WHY?

Renumber is a very powerful tool for developing programs, but after you use it you may find some strange calculations in your program. What happens is that the number after an asterisk ("*"), as for multiplication, is sometimes mistaken as a line number, and Renumber rennumbers it. So if you had a line:

```
10 A=B*10
```

it might renumber as

```
20 A=B*20
```

The fix is:

```
For RAM Applesoft
| LOAD RENUMBER
| POKE 14342,172
| POKE 14343,171
| SAVE RENUMBER
```

```
For ROM Applesoft
| LOAD RENUMBER
| POKE 4815,172
| POKE 4816,171
| SAVE RENUMBER
```

(Do this on Renumber after copying it onto your work disk.)

Sir:

I read "Low Resolution Graphics in Pascal" by Bill Shepard in the Spring Apple Orchard with great interest. (I am trying to learn programming with Pascal instead of BASIC.) Unfortunately, I could not compile my input. I believe there is an error somewhere on Pages 82, 83, or 84. Can you help?

Thomas Kwai
Wappinger's Falls,
New York

Yes. The VAR declaration at the top of Page 82 should have been at the top of Page 84. On Pages 62 and 63 of this issue you will find the pages from his original listing, showing the "contexts" I have described. It was not Mr. Shepard's error. Note: for the full listing, we remind you that back issues are available. Maybe an answer is to publish disks containing the programs used in the Apple Orchard. What do you think?—PCW

TWO CLASSIC BATTLES WITH A FRESH, NEW, COLORFUL APPROACH — THE SSI APPROACH.

THE BATTLE OF SHILOH: A brigade-level simulation of the first grand battle of the Civil War, pitting the Confederate Army against Grant's troops and Union gunboats.

TIGERS IN THE SNOW: Ghostlike Nazi Tiger tanks and infantry sweep across the dark, frozen forests of the Ardennes against a surprised U.S. force in this division/regiment-level simulation of Hitler's last desperate attack.

When we set out to design games based on the Battle of Shiloh and the Battle of the Bulge, we knew we had to give these classic, favorite themes a fresh, new look and feel. After all, we've established a reputation in strategy gaming for unsurpassed innovation, excitement, and sophistication.

First, we put the games on the Apple® II,* programming it perfectly to eliminate all organizational and administrative headaches so you can give your undivided attention to strategy planning.

Then we gave both games the realism and playability you're looking for. An elegant yet easy-to-use movement system for unimpeded play. Historical detail and accuracy for richness and color. Hi-Res graphics that add even more color. Great solitaire scenarios against the computer. Zones of control. A step-reduction combat system. And more.

Finally, we threw in features you wouldn't expect. For example, TIGERS IN THE SNOW has artillery and airpower allocations along with fuel and supply limitations. THE BATTLE OF SHILOH allows you to fine-tune combat strengths for each side, providing for the ultimate in play balance. It even lets you select risk levels and ferocity of attack (or defense).

For \$39.95 each, these are extraordinary games at quite an ordinary price. So head on down to your local store and check them out today!

VISA and M/C holders can order by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335.

To order by mail, send your check to: Strategic Simulations Inc, 465 Fairchild Dr., Suite 108, Mountain View, CA 94043.

All our games carry a 14-day money-back guarantee.

*48K disc for Apple® II with ROM Card or Apple® II Plus.

STRATEGIC SIMULATIONS INC

As part of our demanding standards of excellence, we use **maxell** floppy discs.

PRINT FRE(ed)

by Val J. Golding
Editorial Associate

Ain't Apple grand! This is the thought that crosses our mind as we sit down to have a blank sheet of paper and a cranky typewriter stare us in the face. (Word processing—what's that?)

In a lot of ways, we are old-fashioned; we don't always accept change readily. But accept or not, it occurs and we must live with it. Growing up with the Apple from its earliest stages adds a dimension not shared by newer owners. Who ever heard of a printer interface card (there was always the game I/O) or a disk drive (sure tape worked just dandy). Now we have the Apple ///; we have an Apple II so loaded with cards there is room for no more, and

what is to come; what can we look forward to.

Recent computer shows shed a glimmer of light. There are many new machines out there, some of which, on the surface at least, appear to offer stiff competition to Apple. Some will survive, become predators; others will not. What will the position of the IAC be? Some rumors that the XXXX computer will even handle Apple software! This is good cause for the IAC clubs to do some serious thinking. Here are some thoughts we would like to nominate:

What percentage of our membership is interested in the Apple from a utilitarian standpoint, i.e., applications only.

Is the percentage of programmers and hobbyists shrinking?

If so, is this unique only to the Apple world as a whole, or is it also true within the clubs?

To what extent do we (as clubs) want to support the Apple ///?

Do we want material on the /// included in the Orchard?

This is but a shadow of the possibilities that come to mind, but the time is ripe. Members can contact their regional directors, or they may address the Orchard directly. What is important is that the IAC needs your thinking. IAC does not set policy, the members do.

Planting a seed...

THE NON-DISCRIMINATOR

The Apple neither knows nor cares what color the fingers of its operators are, or which religious Book those fingers hold, if any. It cares not how old those fingers are, what kind of bodies those fingers may caress, nor whether the operator's chair has legs, casters... or wheels. It doesn't even matter whether fingers are used, or a stick held between teeth.

Which makes the Apple the ultimate non-discriminator. Well, that's obvious; it's a machine. (Strange how we have to remind ourselves of that occasionally.) Humans discriminate on grounds of personal characteristics, machines don't. No great intellectual or moral revelation here.

Apples have become the means to more effective communication for an increasing number of handicapped people, and the means to acceptance and income for a number of people who might have been discriminated against. Example: what other industry so readily accepts the work of a 15-year old as a viable commercial reality, treating it no differently than the work of a 30 or 40-year old if it's as good, which it frequently is.

Look around your user groups too, and the diverse cross-section of personalities (not to mention physi-

cal varieties!) present there. And if you are a male with a hang-up about females who are competent in professional and intellectual pursuits, stay away; some of the Apple's best friends are women—women who are using the Apple to help express themselves as **people**.

Come to think of it, we're all using the Apple to help express ourselves, aren't we? And we don't even think about the personal characteristics of the person who wrote a program, or designed a piece of hardware, or wrote about it. The question is, did the product of that intellect work well or didn't it? The "Beautiful People" have as much trouble learning Pascal as the rest of us, while a person that society might otherwise overlook, for stupid but human reasons, may wind up revolutionizing something.

Because success comes only from intense individual effort, everybody starts on an equal footing. Some wind up in a business activity growing out of Apple involvement. Many, if not all, of the businesses serving the microcomputer industry started as ideas, and were first worked on part-time, the classic story being two guys named Steve who hocked a VW van and started building a funny-looking printed circuit board.

One only has to look around the San Francisco Bay Area to realize that, particularly in today's economy, there is no hobby, industry or business that has a greater disregard for personal characteristics, while at the same time providing a wide range of opportunities for self-advancement and self-fulfillment.

The main point of this discourse is this: in this microcomputer field, personal characteristics don't matter. Nobody gives a reject chip about majority or minority status, physical characteristics, lifestyles, etc. The individual effort put into a program, hardware item, or accessory, can be put in by anyone.

What does matter is the effort and the result. There are, of course, no guarantees of success. The marketplace rewards those who find one or more needs and desires, and fills those needs and desires. In one sense, it's a shame that a large segment of America has forgotten that fact. But there is this benefit: that forgetfulness leaves more opportunity open for you.

Whoever, or whatever, you are.

TC Weigh

GREETINGS FROM CALIFORNIA...

...AT LEAST SOME APPLES ARE

LEAVING THE MEDFLY ZONE...

President's Message

Ken Silverman
President, International Apple Core

Are you looking for help in the areas of programming, special uses for the Apple, hardware, or some special interest? The best place to find help—answers to these and other questions—is an Apple User Group, which is a place to share information.

The International Apple Core receives many calls asking, "Where is the closest User Group in the area of?" In most cases, an existing Club is close by and the caller can join. You'll find a current listing of the IAC member Clubs in this issue of the **Apple Orchard**.

Once in a while, there are no groups close to the caller's location. When this happens, the IAC suggests that the caller start just such a group. The response is, "HOW?"

The IAC has just completed production of a manual to help in starting up a user group. The name is "INIT USER GROUP" (Initialize/

Start Up/How to Do it). The manual includes basic information on formation, organization, publicity, putting together a newsletter, starting a software library (disks to do this are included with the manual), and some sample by-laws.

The manual isn't designed to cover all possibilities; your user group will be different from all other user groups. If you have been operational for a while, this manual will be of less use to you than if you were not yet started.

The IAC's **INIT USER GROUP** manual costs \$50.00. If you do start a User Group, however, and join the IAC, there is a coupon in the manual which will allow your first year's dues to be reduced from \$50 to \$25. This makes the manual's cost \$25.00. If you require more information before purchasing, please write or call the IAC.

On another subject, the IAC Board of Directors is now in the planning stages of obtaining a full-time staff and opening an IAC office. The growth of the IAC has been fantastic, and with that growth comes a great deal of work. Up to this time, that work has been done by volunteers. While volunteer efforts will remain the backbone of the IAC's activities, certain administrative and clerical tasks have reached the point where an effective response to you—the member Club's—needs requires this "system reconfiguration". The manner in which you input, vote, and obtain information will stay the same. Your Board of Directors will still be responsible to the member Clubs in their respective areas; the Board will set policies and goals for the operating staff. More information will be forthcoming on this as it develops.

BUILD A BETTER ERROR TRAP

by Peter C. Weiglin
Cider Press

So you set up a program which requires that data be INPUTed from time to time; a simple idea . . . just tell the Apple what it wants to know. That may be a number "YOUR CHOICE? (1 to 5)", or a string, like "WANT TO GO ON? (YES OR NO)", or "NAME OF STATE CAPITAL:?"

The request is placed there as part of an INPUT statement, which requires a [RETURN] after the date, or a GET statement, which does not require a [RETURN]. The information is then processed by program statements which follow the request.

In most cases, the range of potential answers desired by the program is limited; numbers above or below a valid range (as with a menu) could cause undesirable results. Further, if the request is for a "Yes or No" response, or for the capital of North Carolina, and you input JOE BUDGE, the poor machine is likely to be confused, unless you have taken precautions.

Hence the error trap, a routine for filtering out inappropriate responses before they scramble the program's correct execution (read "CRASH"). It is not news that this process involves the use of IF statements. The idea is to anticipate every potential response, and cause the program to reject any response which does not fit the situation. The rejection may be communicated with as much tact or venom as you desire.

NUMBERS

Take the case of a menu with five choices; the program might look like this:

```
250 INPUT "YOUR CHOICE: ";A
260 IF A < 1 GOTO 250
270 IF A > 5 GOTO 250
    (etc.)
```

Despite the repeated "YOUR CHOICE" printing until a correct in-

put, there is no real explanation of the problem. One solution is:

```
230 GOTO 250
240 PRINT "NUMBER
    BETWEEN 1 AND 5
    PLEASE, DUMMY.": PRINT
250 INPUT "YOUR CHOICE: ";A
260 IF A < 1 GOTO 240
270 IF A > 5 GOTO 240
    (etc.)
```

But, that's cumbersome. There's a 'GOTO' on every cycle even if there's no error (most of the time, we hope), and two 'IF' statements where one could do the job. Like this:

```
250 INPUT "YOUR CHOICE: ";A
260 IF A < OR A > THEN PRINT:
    PRINT "NUMBER
    BETWEEN 1 AND 5,
    PLEASE.": PRINT: GOTO
    250
    (etc.)
```

The result is a more streamlined execution. Still more streamlining could result if the ABS function is used, this way:

```
260 IF ABS(3 - A) > 2 THEN . . .
    (etc.)
```

range were from 1 to 6, then the program line would read:

```
260 IF ABS(3.5 - A) > 2
    THEN . . .
    (etc.)
```

This brings up another wrinkle. In Applesoft, a number like '4.2' could be input. This will truncate to the lower integer. But if the expected answer is an integer (which takes up less memory space than an FP number), you might as well use 'A%', the integer variable.

STRINGS

The other type of information input is a string, viz.

```
350 INPUT "YOUR NAME: ";A$
    or
```

```
450 INPUT "WANT TO GO ON
    (Y OR N)";A$
```

in the 'name' case, or any other item of information, your first concern is that the length of the string not foul up your overall format. Try this:

```
360 IF LEN(A$) > 8 THEN A$ =
    LEFT$(A$, 8)
```

For the Y/N or 'yes/no' condition, you want the program to branch one way or the other. The idea here would seem to be to branch on the less likely answer, and to cause a default condition to the least "damaging" outcome; e.g.:

```
460 IF A$ = "Y" GOTO 700:
    REM BRANCH
470 IF A$ < > "N" THEN PRINT
    "ONE MORE TIME, FAT-
    HEAD!": GOTO 450: REM
    TRY AGAIN
```

Note that line 460 gets the "Y" off on its way. If the answer isn't "N" in line 470, something's wrong, and you need a new answer.

Now, you may say that, "this stuff is great if lots of people will use the program, but I'm the only one who'll use it, and I designed the program, so I don't need all this error trapping.

Chances are you believe in the Easter Bunny too. Your memory (human) isn't as good as you think it is. A year or more later, as you enter data, you just might make a mistake as the keyboard shifts underneath your flying fingers (at least that's what happens to me). The best solution is to protect you from yourself, or anyone else entering data.

Build a better error trap. . . and valid data will beat a path to your Apple.

A WIDE SPECTRUM OF TITLES

Computers for Everybody

Jerry Willis and Merl Miller

This fun-to-read book covers all the things you should know about computers. If you're anxious to buy one, use one or just want to find out about them, read this book first.

ISBN 0-918398-49-5

\$4.95

32 BASIC Programs for the Apple Computer

Tom Rugg and Phil Feldman

Chock full of programs with practical applications, educational uses, games and graphics, this new book for Apple users also includes a special 8 page color section.

ISBN 0-918398-34-7

\$17.95

How to Get Started with CP/M

Carl Townsend

One of the world's most popular operating systems is explained in simple terms. Includes a handy guide on shopping for an operating system, a glossary, a list of hardware manufacturers supporting CP/M and a list of major CP/M software.

ISBN 0-918398-32-0

\$9.95

Take AIM: Volume One

James H. Clark

This lab and learning manual for the AIM-65 and other 6502 microcomputers includes computer precautions, programming basics, and 30 fully documented utility and game programs which teach math, data handling, simulation and more.

ISBN 0-916460-29-0

\$16.95

Year of the Robot

Wayne Chen

This thought-provoking book illustrates how a robot encroaches upon the turfs of religion, morality and philosophy, teaching us how to behave.

ISBN 0-918398-50-9

\$7.95

Small Computers for the Small Businessman

Nicholas Rosa and Sharon Rosa

If you're ever considered a computer for your business but didn't know where to turn, this is the book that will arm you with all the information you'll need to make an intelligent, cost-effective decision.

ISBN 0-918398-31-2

Hayden Applesoft™ Compiler

A Brand New Multi-Phase Compiler That Speeds Your Program Up to 12 Times Faster — And More!

(by Jonathan Eiten) Translate your standard Applesoft BASIC program into true machine code! Now you can write and debug your programs in Applesoft BASIC, compile them and enjoy the speed inherent in executing machine language files! The longer and more complex the source program, the greater the increase in execution speed. Easy to operate, the user just specifies the name of the program to be compiled and may then BRUN the compiler program.

• TRUE INTEGER ARITHMETIC!

Sub-expressions with integer operand(s) are calculated with fast integer arithmetic routines. RESULT: Faster execution time of Applesoft intrinsics which require integer values!

• ARRAY VECTORING!

The Compiler eliminates time-consuming multiplication usually present in subscript calculation by generating sub-array look-up vectors for multi-dimensional arrays. RESULT: Greater speed enhancement for those programs with many multi-dimensional array references. The more dimensions, the greater the increase in speed.

**3.3 DOS Version
Soon To Be Available!**

• MODULAR CODE!

Starting address for a compiled module is specified prior to compilation. A CALL to this address executes the program. Adding 2 to the start address executes the program without CLEARing its variable space or RESTOREing its data-pointer. RESULT: Modules can retain their data between CALLs (local variables). Modules may CALL one another and/or may be CALLED from a real Applesoft program running under the interpreter.

• FULL COMPATIBILITY!

All Applesoft features are supported except: 1) dynamic array dimensioning, and 2) those few statements that no longer make sense outside of an interpreter environment, such as LIST and TRACE. RESULT: In executing the source program, the fact of compilation is transparent to the user.

• SYSTEM REQUIREMENTS:

The Hayden Applesoft Compiler requires 48K of RAM, Applesoft, the Autostart ROM, and at least one disk drive. No other hardware is required, and the product WILL operate in a 64K environment, with a RAM card or Language card, but there will be no increase in compiler space, since the Compiler makes CALLs to the Applesoft ROMs.

1978: Adventure

1979: Air Traffic Controller

1980: Super Invader

**1981: Blister Ball
and Mad Bomber**

Blister Ball

Blister Ball is the first completely original arcade-type game for a computer. Not a copy, not an adaptation, not a spinoff. **Blister Ball** is new—it's a new idea—better than Invaders, better than Circus, better than Asteroids, better than Galaxian. If you've played other games for hours, you'll play **Blister Ball** for days.

How does it work? Well, some mean but fun-loving aliens have produced some bouncing bombs. First they drop one and you've got to position yourself under it and zap it with your laser. If you miss, that's OK. It will bounce around, although each bounce is lower, and you have several chances to zap it. Got the hang of it? OK, here come two bouncing bombs. You zap them. Then you're faced with three, then four and five.

As they bounce longer and longer the walls begin to close in so you're faced with either zapping the bombs or being hit. Each hit knocks you a little further toward the gutter. But you can survive two hits which is usually enough to zap all the bombs.

Feeling confident? Don't. Because after 5 bombs the murderous little devils drop 5 bonus bombs, worth ten times as much. These don't bounce, so you get only one shot. You need nerves of steel and the reflexes of a tail gunner.

After you complete one round, the game starts again with bombs that bounce faster and lower (and are worth more) than the previous ones.

Blister Ball is a fantastic solo game. But there are two-player options as well in which players can play as a team or as opponents. Each player can move the entire width of the screen and zap any of the bombs. Here, you're not only trying to survive, but trying to outscore your opponent. The game has two skill levels.

Mad Bomber

In **Mad Bomber** you are faced with aliens in a huge ship hovering overhead. They have bomb racks which they constantly fill with bombs. Your object is to move from side to side on the ground and zap the bombs in the bomb racks or as they fall.

As the game progresses, the aliens fill up their bomb racks more quickly and the bombs fall faster. You lose after ten bombs have hit the area which you are defending.

Mad Bomber can be played by one player solo or by two players as a team or as opponents. Two skill levels.

Order Today

Blister Ball and **Mad Bomber** are available together for \$29.95 on disk (DOS 3.2) only and require a 48K Apple with paddle controls. (We recommend using the Super Paddles from Peripherals Plus).

To order send \$29.95 plus \$2.00 shipping and handling to the address below. Credit card customers should include card number and expiration date of Visa, MasterCard or American Express card. Credit card orders may also be called in to our toll-free number in the continental U.S.

If you also wish to order a set of Super Paddles from our Peripherals Plus subsidiary, the cost is just \$39.95. The paddles are backed by a 90-day limited warranty from the manufacturer as well as Peripherals Plus' moneyback guarantee of satisfaction.

Blister Ball and **Mad Bomber** are colorful, challenging, fast and noisy. They are the games of the year from Sensational Software.

What Does an Apple Taste Like, Eve?

by Marion D. Jett

I drew the Apple pendant across my palm, thinking how it symbolized the love of friends—an early birthday gift from fellow Apple owners far away. The word “symbol” turned a switch inside my brain and I began to look at the dangling metal apple closely, seeking its meaning, its symbolism.

“Why an apple?”, I asked aloud. Why not a plum or pear or berry, I wondered.

And why a **rainbow-hued** apple? Why not a red or yellow or green one? What **did** I hold in my hand? What did it mean?

I let my consciousness stream on until, after a few moments, I had reached a few conclusions. I'd like to share them with you—one woman's fanciful attempt to explain, “Why an Apple?”

I asked myself, “What was the apple's genesis?” Ah, **Genesis!** I thought, and pure fantasy overtook me.

There's a great deal of Biblical symbolism in this little apple. (Bear with me, agnostics and atheists; look at this as the literary legacy of an ancient people trying to explain their

origins.* In Genesis, the first book of the Bible, is recorded the story of the famous apple in Eden's garden. That apple hung on the tree of the knowledge of good and evil and Man could not resist its temptation (Gen. 2:15-25; 3:1-24,RSV).

Eve bit and so did Adam. So, now I was left with an apple (no color recorded) with a bite out of it. It was probably Adam's apple which was left; Eve must have eaten all of hers.

The phrase, “tree of the knowledge of good and evil,” kept echoing in my head. Good and evil... plus and minus... truth and non-truth... aha! **1** and **0!** That's the way an Apple sorts data. It fit... knowledge like that of the Gods... infallible.

But why was the apple multi-colored? What was the genesis of that? Back to the Book.

Genesis 6:5 begins the Noah story that ends after the flood with a covenant between God and Man; its sign was the **rainbow** (Gen. 9:17). Rainbows become God's memory hooks. They always reminded Him to turn off the rains before another world-wide flood began.

Great, I thought; rainbows are for remembering. Of course! ROM, RAM, disks, tapes... all parts of a well-known system for **remembering**.

But I still wasn't satisfied. None of my speculations had pierced the core of the symbolism I sought. I fell back to Man's most elementary method of seeking knowledge of a strange new object. I examined the apple lying in my hand with my five senses.

Quickly, the checklist: 1) Hearing—silent; 2) Sight—as described above; 3) Touch—not applicable for symbols; 4) Smell—nothing. But 5) Taste, gave me pause.

No, I didn't bite the metal necklace. I just looked again at the missing bite of the design and asked, “What did that Old Testament apple taste like when man and woman first knew it?”

Well, after eating the forbidden fruit, Adam and Eve traded eternal days of joy in Eden for the uncertain tomorrows of the world-at-large.

“**THAT'S IT!**” I yelled. That's what it tasted like. It was a **taste of tomorrow!**

Sighing with contentment, I hung the necklace on its hook in my jewel box. I walked downstairs, sat at the Apple keyboard and looked around the family room where it was set up. Across the room stood a television set with interactive cable. Tomorrow, not too long after today, technology will join the TV set and the Apple to the world and I'll be doing my shopping and banking in this room. I glanced at all the "peripherals" my husband had assembled to operate our security system, the kitchen appliances, and all of the toys and gadgets we own. What marvels lay within our reach! Already our finance and correspondence were stored on disks. Maybe tomorrow would bring a robot to clean the house. After all, our Apple II Plus was but an *hors d'oeuvre* of the banquet ahead.

As I turned back to the Apple, the bright logos on the keyboard and disk drives stood out boldly against their neutral backgrounds, symbols of the machines waiting to serve me. Yes, now I know what I'll think each time I see those symbols. The Apple has given us, its users, a look at what is coming. It has given us a taste of tomorrow!

©1981 by Marion D. Jett.

Marion D. ("Rusty") Jett and her doctor husband Roy succumbed to temptation and purchased an Apple II Plus in late 1980. Mrs. Jett is a "housewife" who writes, who is business manager of a medical practice, who enjoys travelling with her husband (they're both licensed pilots), and who is active in politics and government service. Until recently, she was President of the Transit Authority serving the Cincinnati, Ohio area. Roy and Rusty have also become active in the Cincinnati Apple-Siders.

*The author understands that none of the preceding ideas may have been in the thoughts of those who chose a bitten, rainbow-colored apple for the Apple Computer logotype. She also understands the difference between exegesis and proof-texting when seeking inspiration or confirmation from the Bible. She trusts God forgives her her whimsical ways and begs all readers to do likewise.

THE APPLE NOBODY KNOWS

by Alan Anderson

The story of the Apple /// is a fascinating one. Although this computer has only been public knowledge for about a year, its existence has had a profound effect on Apple Computer, Inc. and those of us who use their products. If you own or use an Apple II, you know about the Apple ///. You may have seen it lurking in a corner of your local computer store, with full color horses parading across the screen; you may have read about it in various magazines that have detailed its problems; but you probably have not discovered the real inner workings of this system. If you are a business user, you may be surprised to hear of some of its potential applications; if you a computer hobbyist, you will be interested in the amazing power hidden inside that curved chassis. Now let's explore together the past, present, and future of the still-mysterious Apple ///.

What Happened

The fact that an Apple /// would someday appear was never a secret. For at least a year before the Apple /// was introduced at the National Computer Conference in May 1980, the rumors flew fast and hard. But when Apple introduced the new system, the predictors were caught off guard. **Apple Magazine** proclaimed "A New Star is Born", but there were mutterings of "birth defects"; many were not impressed. Sure, it was pretty, but where was the hard-disk drive? No built-in color monitor? No Pascal in ROM? No 68000 microprocessor?

Of course, the Apple /// was missing these and other things that some folks had decided were essential. If the new computer had had a normal chance to show itself off, these design decisions would have been adequately explained at your local

dealer. But a "normal" introduction period for the /// was hardly what occurred.

Of Clocks and Sockets

At NCC, Apple said that the first shipments of Apple ///'s would be dealer demos, one per store, and that they would start shipping in June. That schedule was quite optimistic, and it soon began slipping by several weeks. Then, it got worse: Apple began shipping demos, but they rarely worked. Apple's reputation for quality, won with thousands of trouble-free II's, began to deteriorate as the Apple /// saga unfolded.

Example: Apple discovered that their chip sockets were doing a lousy job of holding the integrated circuits in place, and that the slightest vibration in your friendly freight truck was enough to unseat the chips, placing the /// out of commission. This was a rude surprise for the unsuspecting Apple dealers. Ruder surprises awaited those who bought the first working computers; they frequently went dead after being installed in home or office, adding to the hassle. One solution was to allow the /// to fall vertically for 6-9 inches to a surface capable of providing a sudden stop, jarring the chips into place. The apparent brutality of this celebrated "drop fix" for sophisticated equipment gave rise to the suggestion that the "drop fix" might well be applied to a few engineers and marketers.

So, new sockets were used, with a tighter grip, but Apple ///'s were still failing. Eventually, Apple discovered that the new sockets were tighter all right, but were jamming the chip pins back around, missing the socket. Again, they fixed the problem. Still, there were other hardware problems. The built-in disk drive sometimes didn't work if a plastic-

enclosed monitor was placed on top of the unit. There were rumors of a nasty solder bridge on the motherboard, and of inadequate heat dissipation. Finally, after much work, Apple declared its reliability problems solved.

It should be noted that until June 1981, Apple's repair policy on ///'s was a model of simplicity: you send yours back and they send you a new one, fast. Having been through this procedure, I must say that even the most skeptical user comes out with his feelings soothed. Apple didn't even wait until the sick one got there before shipping the new one. More recently, Apple has started selling Apple /// service kits to its Level I service centers.

Then, there's the clock. When Apple announced the ///, one of its proudest features was a built-in clock/calendar chip that linked it to the operating system and stamped time and date on all your files. Well, bizarre things started occurring with the clock. The month began showing us as "???", and the hour would climb whimsically into the 30's and 40's before realizing that a new day was dawning. Since any boot diskette automatically displayed time and date, this particular black eye got great exposure.

Eventually, Apple announced that it was unable to find a reliable large-volume source for the clock chips, and stopped putting them in. The retail price was lowered \$50, and Apple /// owners were offered a \$50 rebate. Someday, when good chips can be obtained, the clock will go back. Someday. . .

But What Will it Do?

The Apple ///'s hardships have not been limited to hardware. The Sophisticated Operating System

(SOS) had some problems, quickly resolved, but became known as a memory-eater. Business BASIC still contains bugs, but the /// does a good job of emulating a single-language Apple II. There was virtually no software, except for the 80-column VisiCalc ///; people were hearing things like, "I spent \$4000+, and got VisiCalc and a paperweight!"

Schedules and release dates slipped further and further from initial estimates. Pascal was scheduled for August 1981 release... see if it's out with this issue of the Apple Orchard. Other languages and software, like COBOL and Fortran, have also been subject to delays. The biggest blot in the software area has been Word Painter, Apple's high-quality word processor. This product is now more than a year behind schedule and is forecast to appear late this year. These delays, it seems, will have been worth it; the products are undergoing extensive testing, and will be of higher quality than if Apple had rushed them to judgment in the rumor-ridden marketplace.

The Past is Behind Us

At last, it looks like Apple /// the Product is coming together. Local service is becoming available, as is the Extended Warranty. Reliability is up, says Apple, to a level comparable with the Apple II. And there are fewer gripes, growls, and whines coming

from Apple /// owners within my earshot. (Not "none", just "fewer".)

So what's holding it back now? Two things. The first is the acute shortage of software. There are virtually no application programs available, and programming tools are likewise non-existent. There is as yet no assembler which provides the proper interfaces with the Apple /// operating system. The appearance of abundant software would greatly help the Apple ///.

But that's one of the things being retarded by the second problem, which is the image of the Apple /// as a stiff! Until dealers and consumers see the system running reliably, it will not be accepted as the Apple II has been. The tragedy is that public perception lags behind the actual improvements by three to six months; programmers who could solve the software shortage are reluctant to invest time in a machine which they hear has problems. Only time can cure this one, depending on the rate of improvement of the Apple ///'s public image.

The Goodies

Now that I've spent your time telling you about the checkered history of the Apple ///, why should you be interested in hearing more about the thing? Because the Apple /// is a uniquely well-designed personal computer system, remarkably

powerful, and it has been plagued by stupid things like bent pins, solder bridges, corporate PR games ("what clock?") and negative attitudes. The Apple /// itself deserves a closer look.

The most obvious factor in the Apple ///'s design is the legacy of the Apple II. The /// reflects many of the things that were done right on the II, such as expansion capabilities; and corrects some of the hassles of the II, such as combining all languages under one operating system. With the Apple II as a sound base, the Apple ///'s design begins to take form. The standard memory configuration is 128K RAM. The microprocessor starts out as a 6502 A, a faster version of the Apple II's brain, and then has its capabilities enlarged by some additional circuitry. The built-in disk drive is basically the same as the ones we get for Apple IIs, with the same 140K bytes of data per diskette. Up to three more drives can be plugged into the back with no additional controller needed.

The Apple ///'s keyboard is a more complete version of the II's. All 128 ASCII characters are typeable, including full upper/lower case and alpha lock key. All keys have auto-repeat just by holding them down. A numeric keypad sits adjacent to the main keyboard. There are arrow keys for all four main points to the compass, and each of these keys has auto-repeat with **two** speeds, depending on how hard the key is pressed.

The Apple /// provides three different forms of text screen output, starting with the 40-character wide by 24-line high screen we see on the standard Apple II (40x24). The second mode is 80 characters wide by 24 lines high (80x24). The third mode is 40x24, but with the capability to make each letter, and each letter's background, any of 16 colors! But the real topper is that for all three text modes, the character set is defined in Random Access Memory (RAM), not frozen in Read-only Memory (ROM). This means that you can redefine the way characters look; so you can print different fonts, Japanese characters, even characters that look like horses. (Uh huh... that 16-color horse demo you see isn't graphics at all; it's text mode, with the characters redefined.) Those of you who have seen the Hi-Res Character Generator in Apple's DOS Tool Kit are familiar

with the technique of redefining the character set. However, there's a big difference: on the II, this has to be done in graphics mode, and it's slow. On the ///, it's done in text mode, so it's just as fast to print horses, frogs, and Greek as it is to print the English alphabet.

One of the Apple ///'s more interesting concepts is its lack of ROM; the only ROM code in the machine is a 4K byte program which simply runs a quick test on the unit's hardware and then boots the disk. Once that disk is done, this ROM is replaced in memory by RAM—no space wasted.

If you're familiar with the Apple II's insides, you know that the memory from \$C000 to \$CFFF is used for input/output by built-in and peripheral devices. Well, in the Apple ///, that's how it's used too... sometimes. There's another neat little trick in the /// that causes this area to be RAM too. Those of you in the audience who are quick-witted will notice that, with the switches set properly, the ///'s memory looks an awful lot like

an Apple II; at other times, the whole memory space becomes RAM. (See Figure 1).

Why have all this RAM? It makes the Apple /// very "open-minded". With no language in ROM, the /// doesn't lock itself to the present selection of languages. If the Apple II had been made with all RAM, we wouldn't need a Language Card to run Pascal. Of course, we would have had to load BASIC by cassette, since the disk drives didn't exist when the II first appeared. But with the ///, everybody has a disk drive, so loading the language—any language—is fast and easy. By the way, not only does the /// load the language from disk, but also all the operating software, the character set, even the keyboard layout which designates how the keys correspond to the character set.

Speak to Me

The Apple /// has interfacing capabilities too. Even the standard I/O is kinda fancy. For example, there are three different video signals avail-

able: NTSC (standard) black and white; NTSC color, and RGB (studio quality) color. The black-and-white plug causes the colors to appear as sixteen shades of gray. There are also three different audio generators. One makes a beep, another makes various one-bit sounds (just like the Apple II), and the third is a 6-bit digital-to-analog converter that gives greater resolution to sounds.

The Apple /// has a serial interface built in, suitable for hooking up printers and modems. There is also a built-in interface for Apple's Silentype printer. The Silentype connector and one other port are also joystick hookups, and it's quite simple to modify many of the existing joysticks for use with the ///.

Inside the Apple are four 50-pin slots very much like the ones in the Apple II. In fact, the FCC may not like it, but you can plug in many Apple II peripheral cards and they will work fine.

And Now, the Rest of the Story

This part is for the hobbyist, the experimenters, and the curious hackers among you. If you've had your Apple II long enough to remember the discovery of (POKE 33,33) in editing, the advent of the S. H. Lam Monitor routine, or the first CHR\$ function for Integer BASIC, then you know what the early days were like. Well friends, come join me as we explore the secrets of the Apple ///. Most of these things are not yet documented, but already they are starting to become known. One day, Apple Computer Inc. will document them, and then we'll all know these things work to a very high degree. Until then, we present for your interest, Untold Stores of the Apple ///!

1. The Monitor Lurks Within

Inside that 4K diagnostic/boot ROM mentioned earlier is the first real development tool available for the ///: the Monitor. The Monitor is based on the Apple II Monitor. Several commands are the same as the II; specifically: the ones for dumping, moving, and verifying memory, and the G command are the same. The existence of this Monitor, though undocumented publicly, is now fairly well known. (But, people at Apple have said that the Monitor may not be included in Apple ///'s after some point.—PCW)

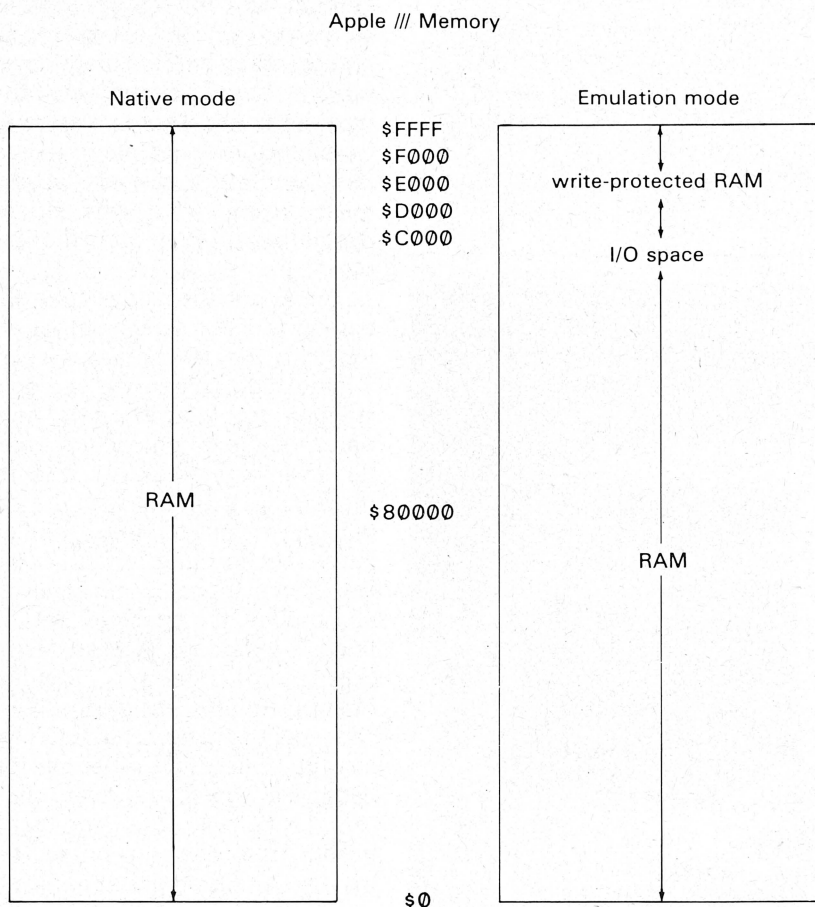

Figure 1

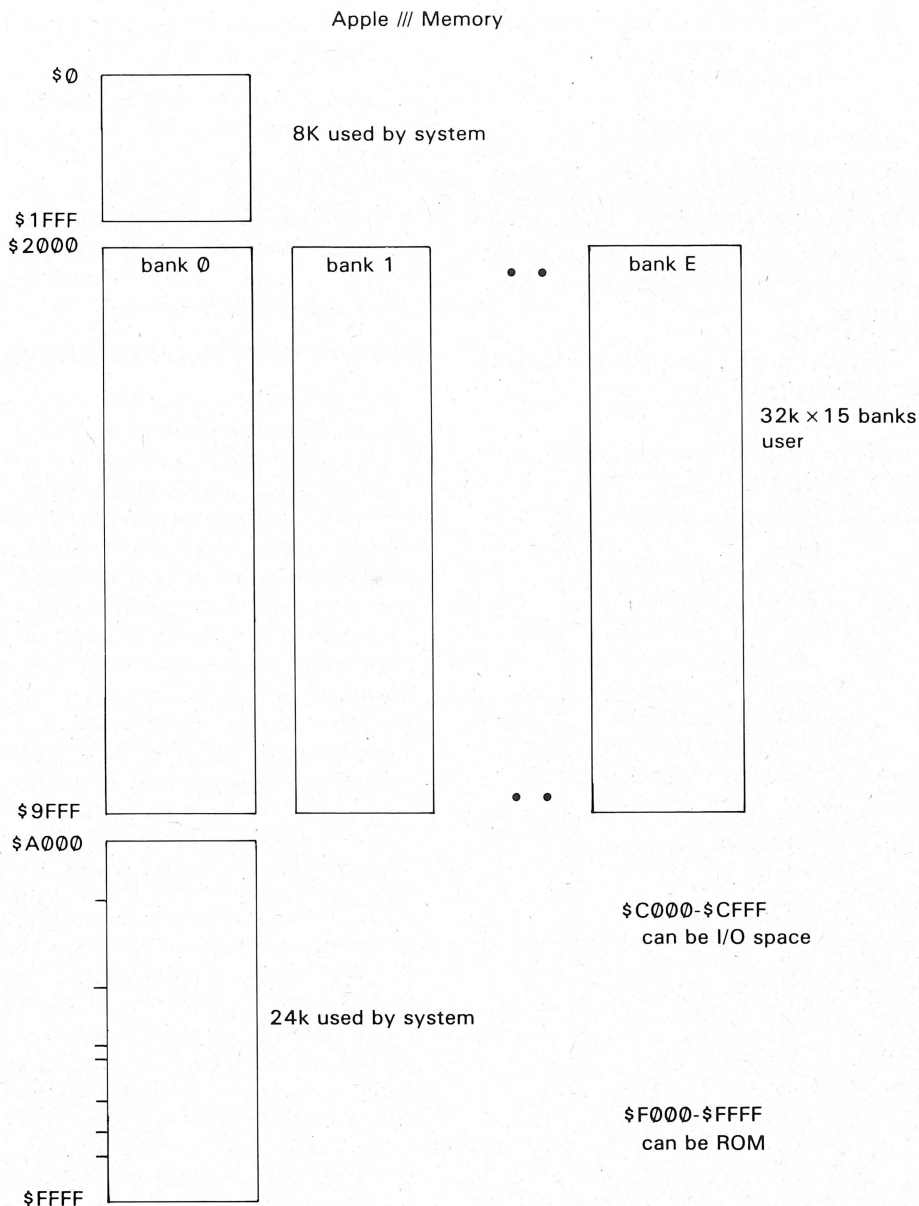

Figure 2

Here are the other commands:

- A. (byte)<(addr) . S
—searches the range of addresses (addr) for the given byte.
Example: B5< 3000.3FFFS
- B. (blocknum)<(addr) R
(blocknum)<(addr) .
(addr) R
—reads the disk from the given block number into the given addresses. Blocks are 512 (\$200) byte chunks, as with Pascal. One diskette contains 280 (\$118) blocks. If you use the second form, enough consecutive blocks to fill the address space given will be read.
Examples: 4A< 1000R (reads

- \$4A into \$1000-\$11FF)
107< 2500.28FFR (reads blocks \$107-108 into \$2500-28FF)
- C. (blocknum)<(addr) W
(blocknum)<(addr) .
(addr) W
—writes to the disk. Analogous to the READ command above.
- D. (addr) J
—performs a jump (JMP) to the address given.

The Monitor comes up in 40-character mode. To switch to 80-column mode, press (ESC)-8. Pressing (ESC)-4 puts you back in 40-mode. To put more than one command on a line, put a slash between each pair.

To stop and start video output, press the space bar. Press (TAB) to abort a listing. To enter the Monitor, press and hold (CTRL) and (OPEN APPLE) down; press and release (RESET). Keep holding the others until the Apple beeps. Have fun!

2. Banks for the Memories

One of the most oft-asked questions about the Apple III is, of course, "How does the 6502 address all that memory?" There are lots of cute answers to that one: "Very carefully...", "With mirrors...", "Slowly...", and others. Actually, the masses of memory in the III are handled through the time honored tradition of bank switching. Figure 2 gives you an idea of how it works.

First, you'll note that the 32K chunk from \$2000 to \$9FFF is replicated a number of times. This is called the User Area, and in the 512K Apple III (theoretical for now) there are 15 of these, numbered from \$0 to \$E. Each of these 32K areas is called a bank. The one currently being addressed is determined by a memory-mapped register called the bank register (pretty tricky, eh?). This register is located at \$FFEF, and you can change it in the Monitor. Normally, SOS handles all the necessary switches between banks from high-level languages. Oh... the present 128K Apple III contains three User Areas, numbered \$0 to \$2. Some owners have added a fourth area (\$3)... they hope... by upgrading memory to 160K.

In addition to this switching of RAM areas, the III has two other bank switches. One controls the area from \$C000 to \$CFFF, selecting whether this space is RAM or I/O ROM. The other controls \$F000 through \$FFFF, which can be ROM or RAM, as mentioned earlier. These switches are kept in the environment register, described next (read on!).

3. Environmental Impact

Some of the Apple III's magic tricks are controlled by another memory-mapped register, the environment register. This register is mapped in at \$FFDF and is shown in Figure 3.

Explanation:

Bit 7: When in the Emulator mode, this switch is set for 1 MHz to emulate the Apple II's clock.

- Bit 6: This switch chooses what goes in \$C000-\$CFFF (see bank discussion above.)
- Bit 5: This switch allows the video generator to go off, thus speeding up processing.
- Bit 4: Turns off (RESET).
- Bit 3: Used to write-protect \$C000-\$CFFF in emulation mode.
- Bit 2: Maps the 6502 stack to a different location or normal (\$100-\$1FF) location.
- Bit 1: Selects between two ROMs which may be mapped into the \$F000-\$FFFF space.

Bit 0: This switch chooses whether RAM or ROM goes into \$F000-\$FFFF.

Of course, this register may also be manipulated in the Monitor. Warning: it's easy to lose control and be forced to power off-and-on. However, you can't hurt the hardware, so your investment is protected.

In future articles, we'll cover some of these items:

- How to write Invokable Modules for Fun and Profit;

- How to communicate with the omnipresent SOS;
- Low-level secrets of the Mysterious Keyboard;
- and even more!

Stay tuned to the **Apple Orchard** for future developments, and perhaps the Apple III will no longer be "the Apple Nobody Knows".

BIT	USE	if off	if on

Alan Anderson is a writer and computer programmer who has a number of products and product improvements to his credit. His articles have appeared in virtually every popular journal of the Apple III world, admittedly a limited circulation so far. He is also an advocate of chemical spraying to prevent software bugs.

Mr. Anderson purchased an Apple III during the Dark Days, and has stayed with it through thin and thin. We hope to chronicle his and everyone's progress toward the brave new Apple III world.

1st issue out late Sept., 1981

THE HERO, THE SWORD, AND THE APPLE

by Donald Brown

A new type of game has swept the world's computers. No longer are gamers sweeping away foolish Klingons (or Klarnons or Klopklups). No more little bricks are being knocked out. No invaders are being wiped out with beeps and buzzes. Instead, the gamers are wandering through underground tunnels and old houses, trying to defeat the puzzles and monsters that abound.

These new games are called "role-playing" games, although that isn't quite accurate because almost all computer games put you in a different role. (You don't **really** clear asteroid fields for a living, do you?) The difference is that these games have you directing the action of an individual, not the ship or whatever vehicle around him/her. These games are the foster child (I might use another parental description, but not in a family magazine!) of a non-computerized game called "Dungeons and Dragons".

So this article will try to shed some light on these games—how they came to be, what's there now, and what they might become. I'll be mentioning a new game called SwordThrust, which in my unbiased opinion is the absolute best Computerized Fantasy Role Playing (CFRP) game available today. **(Mr. Brown's opinion of SwordThrust is understandable, inasmuch as he wrote it.—Ed.)**

The slew of CFRP games can trace their inspiration back to the first fantasy role playing game of Dungeons and Dragons by Dave Arneson and Gary Gygax. Although many other FRP games (non-computerized) have come along, D&D is still the prototype for fantasy role-playing.

In D&D and the like, roughly six people get together to play the game. All but one of the people assume the roles of characters that exist in a weird, magical world. Numbers are randomly generated to define how strong, agile, intelligent, and attractive these characters are. The players also buy armor, weaponry, and other supplies for their characters to use.

The remaining player is called the Dungeon Master, and he represents the rest of the universe. Before the other people come, the Dungeon Master designs a tunnel complex (or a building, or whatever) that the characters will be exploring. Then, when everybody gets together, the Dungeon Master runs the game by telling the other players what their

characters see, and interpreting the results of the characters' actions.

For example, the Dungeon Master might tell the party that they are in a long corridor with a door at the north end. One of the players says that his character, Sidney the elf, tries to open the door. Chuckling evilly, the Dungeon Master tells the group that the door was booby-trapped; when it was opened, a trap-door opened in the floor, and the entire party fell in. They now find themselves facing a dragon, one flight down.

Eventually, the characters will have killed all of the monsters, and will have taken the treasure from the place (or, will have been so badly scared that they leave, vowing never to return). These characters then re-

turn to a town where they can purchase new and better gear to be used in the next set of crises to be devised by the Dungeon Master.

No two ways about it, after a hard day's work at the office there's nothing that beats relaxing by slaughtering an orc patrol. Unfortunately, not only do you need a fairly large number of people around to play the game, but you also need a person with a creative mind and a capacity for work (read "sucker") to act as Dungeon Master. Not only does Dungeon Mastering require a lot of work, but a poorly run game is worse than watching "My Mother the Car" reruns on the boob tube. Since the major problem in fantasy games is the quality of the Dungeon Master, there must be a better way... and for one or two people too, not only a larger group. Hmm... maybe a computer...

Enter Woods and Crowthers, from MIT. They developed the first game of Adventure. In it, you talked to the computer, giving one- or two-word commands as it led you through the Colossal Caves. Your goal was to pick up as much treasure as possible by getting around inanimate blockades. (Some of

these blockades were disguised as monsters, but they merely sat there, blocking your way. Speaking of which, how do you get past the green snake?)

Many other Adventure games have been written. Although most games use the same format as the original Adventure, some games have added graphics, trying to represent what you see on the screen. This isn't necessarily a step forward, as the computer display images are far less detailed than what the mind might conjure up unaided. Put another way, nobody can scare you as thoroughly as you can. However, the pictures on many adventures—particularly the superlative "Wizard and the Princess" by On-Line Systems—are quite good. Automated Simulations has tried to satisfy both sides by drawing a picture on the computer's screen, and also having descriptions in a booklet to which you can refer. Trying to look up these descriptions can be distracting, but they're there.

Probably the consistently highest quality adventures have been written by Scott Adams, but many other authors have entered the act. A few I'd personally recommend are "The

Wizard and the Princess" by On-Line Systems, "Lords of Karma" by Avalon Hill, and "The Prisoner" by EduWare (be prepared for hours of utter frustration with this one).

What's wrong with today's crop of games? Well, starting with a minor gripe, I have grown very tired of "Guess the Word I Want". This is a sub-game which the computer plays with you; you know what you want to do, but what syntax will enable the machine to understand? The very worst case I found was in one game. I was standing in front of an open door to the north of me. I want to go through the door. I try "NORTH", "ENTER", "ENTER DOOR", "ENTER BUILDING", all with no luck. Believe it or not, it wants and will accept **only** "GO DOOR", which may come naturally to the Incredible Hulk, but not to us semi-normal types. The problem is confounded by the fact that there is (usually) no way to get a list of acceptable commands. Even a list of the acceptable action verbs would be a great help.

This is part of the overall problem that any computer program is not going to be as intelligent as a human running the dungeon would be. A far more serious result is that the computer program will permit the player to be no more creative than the programmer was. Example: a locked door in the dungeon. Elsewhere, a chopped-down tree. Aha. We'll get the tree and use it as a battering ram to knock down the door. But if the programmer didn't tell the computer what to do when a player tries this, the computer can only give a small "I DON'T UNDERSTAND" or "NOTHING HAPPENS" (which is patently ridiculous). Unfortunately, this problem is not likely to be solved; a good human Dungeon Master will outperform the machine. (Whew!—Ed.)

Another major area in which most adventure games fall short in comparison to fantasy role-playing games is in combat. Most Adventure games simply do not have satisfying combat rules. Combat is either predetermined (if you attack the first beastie you kill it, if you attack the second beastie it kills you, etc.); or governed by one random number regardless of conditions (you will kill the dwarf 50 percent of the time, the dwarf will kill you 25 percent of the time, etc.). The non-computerized games have a much richer combat system, with your chance of hitting

WANTED

SOFTWARE AUTHORS!

for Apple, Atari, TRS-80, NEC, Hitachi. . . .

Brøderbund Software is looking for new authors to join its international team of programmers. If you have a product for the micro market, let us show you the advantages of working with our team of design, production and distribution specialists.

(and how much damage you do) based on a variety of factors such as your dexterity, the weapon you use, and your experience.

For the dedicated game-player, the greatest shortcoming of the computer games has been the survival and growth of characters after each episode. The non-computerized D&D process involves such growth in wealth and skills for the characters. The party leaving a dungeon has new knowledge that will help them in the future, they have gold to buy more supplies, and possibly a powerful new weapon or two. In many computer games, once your character has killed the vile beastie, has stripped the rooms of all their treasure, or has escaped from the island alive, that's it. You could play another game, or even play that game again (if there is enough randomness to make it interesting), but all that effort you put into the dungeon and all of the wealth you took out is irrelevant.

This concept of character growth was important to me in writing SwordThrust. The first or master diskette has programs that control the creation and equipping of your new characters, and there is a cavern

provided as a scene for their exploration and looting activity. Further adventures are and will be on separate diskettes, but the characters' personal histories and accumulations will be stored. I have also tried to make the combat situations more realistic. The type of weapon you choose has a great effect on how effective you'll be with it; and the longer you use a weapon, the better you'll become with it.

The "richness" of a game is proportional to the amount of detail and the number of alternative courses and effects. These in turn are limited by the computer's available memory and the disk's capacity for storing data. HiRes displays in particular are large memory consumers. The two-disk system is one solution to the problem of memory capacity. And with hard disk storage using the contents of many diskettes on line... oh boy!

What's to come in CFRP games? In a word, more. In addition to new, exciting, and even more clever text adventures, HiRes graphics adventures are possible. Even animation. Competitive games between two players are in the planning stage. This could even be two or more play-

ers with separate computers, connected by phone line and Modem. How about games using speech synthesizers and speech recognizers? Games using bio-feedback units? As with magic, with computers, all things are possible.

But lo! Hear the muttering of monsters from your RAM chips! See the shine of gold glowing from your keyboard! Smell the mildewed walls rising from your disk drive! The dungeons are waiting. Put aside your word processor, your CalcCalc program, your checkbook... and come!

Donald Brown is a recent graduate of Drake University. He became involved in microcomputing when his father bought an Apple II with a serial number of 124. Many popular programs by him can be found in various computer clubs' program libraries, including AUTOMATIC MENU, STAR WARS ADVENTURE, FIZZBIN, and THE WONDERFUL WORLD OF EAMON. He is currently working for CE Software, a new software firm from Des Moines, IA.

HOW TO GET THE SOFTWARE CATALOG WITH APPLE'S STAMP OF APPROVAL.

We're picky at Apple. So you can imagine how picky we are about which programs we included in our catalog called Special Delivery Software. No, we don't develop these programs here at Apple. But they're so well done, so applicable and so easy to run that we give them our Special Delivery stamp of approval. They're useful and exciting programs - special programs you've never heard about before. But the only way you can get these programs is through our Special Delivery Software catalog. To get this catalog and all the catalog products, just visit your local authorized Apple dealer. Or grab your nearest telephone and dial. The phone call won't cost you a cent. And neither will the catalog: (800) 538-8400. In California (800) 672-1424.  apple computer inc.

APPLE II DISK SOFT SECTORING

by Gary Morris

DISKETTE NIBBLIZING

Data stored on a diskette is encoded into nibbles. There are 128 possible nibbles (because bit 7 must always be a 1), however some are reserved for markers and sync. When encoding data, the 256-bit bytes are split up into 342-bit nibbles.

When writing nibbles it takes 32 microseconds to shift out the 8 bits, plus one extra shift produces the trailing zero.

A nibble is read from the shift register by waiting until the byte in the shift register is negative (bit 7 is 1). This signals that the nibble is fully shifted in. The shift register is zeroed before the shift is started, and all nibbles have a 1 in bit 7 so it is easy to tell when the shift is complete. A bit is shifted in every 4 microseconds, it takes 32 microseconds to fill the shift register plus an extra 4 for the 0 after the nibble, for a total time of 36 microseconds.

SELF SYNC

The self sync feature allows the software to search the data coming from the disk entering at any point. The program looks until it finds the sync field. Then it locks on and steps into the true data and address information. The bit pattern is then read in the proper sequence. Zeroes act as frame for 8-bit sync byte. See the diagram at the end of this article.

The following dump is of actual nibbles that were stored on a diskette. It is from a 16-sector disk. The actual data contents of the sector was 256 bytes of 0's.

HAM 'N APPLES

by Jim Hassler
WB7TRQ

Our Apple computers are like common aspirins; every day, a new use for them is found. Take for example, my "other" hobby, Amateur Radio. Another term for amateur radio is "Ham" radio, and the Apple and ham radio go together like ham and eggs.

How would you like to have a friend in Europe who has a great program he has just finished and in five minutes have it; even though you live several thousand miles away? It's now possible.

Or, say you are having a problem writing a program and it has you stumped. You mention it to a friend in Asia and right away he gives you an answer for your problem.

You're probably thinking that you're not the type of person to become an amateur radio operator. Let me mention the names of a couple of people who have been hams: Steve Wozniak (who also flies an air-

plane). Ken Silverman, your International Apple Core President. And quite a few other Apple owners, as you'll see shortly. Can you still say you're not the type?

Some of you just don't have the time required to study for the test; more on this later. But that shouldn't stop you from enjoying part of ham radio, because no license is required to **listen**. (Now, tell me what your excuse is. . .)

When a group of hams get together, it's not called a "club", it's called a "net". There are currently four Apple computer nets on ham radio. One meets EVERY Sunday night, two meet EVERY Saturday morning, and the fourth meets on Wednesday night. A great many people just listen; the mail I get indicates that we have a lot more receivers than transmitters out there.

Let's look at what goes on during a typical Sunday night "AppleNet".

The net starts at 0100 GMT. That's 6 PM in the Pacific time zone, 7 PM here in Wyoming (Mountain time), and 9 PM in The Eastern time zone. Remember, this is EVERY Sunday. You'll find the Net at 14.329 MHz. I'm "Net Control", another word for President. My amateur call sign is WB7TRQ. **(TRQ?? Lucky that Jim wasn't two applications lower in the stack, or we'd really have confusion.—PCW.)**

The net starts with my giving out all the information I have scrounged during the past week. It may be the latest on graphics for the MX80 printer, the latest on new stuff from Apple and others, a report on a new program that I have just received and like or dislike. This is one of the purposes of the Net; to evaluate new software and hardware, and possibly to help you make a better-informed decision on whether an item is what you're looking for. We then go to

AF6W and WA6SZC, Alex and Micky in California, to see what they have gleaned in the past week concerning the Apple and anything related to it. And so it goes. . . news and more news about our favorite computer.

We then ask if anyone has an Apple in need of repair and, if so, would they please tell us what the problem is. The Net is queried for someone who may have the answer. (Two Steves can be proud, because not much time is spent on this part of the Net). Next, we ask if there are any check-ins outside North America. If memory serves me correctly, Africa, England, Germany, Iceland, Sweden, South America, islands in the Caribbean and many other countries and continents have checked into "The Apple Computer Net". After talking to these far-away countries, answering their questions and receiving their comments, we start taking "local" North American check-ins. When someone asks a question, the whole net of transmitters is available to answer it. Each question may not be answered that week, but next week you can be sure someone will have the answer. The Net will last about three hours, so you can imagine all the information exchange that goes on.

Well, have I raised any interest in ham radio? For those of you who have a short wave radio, remember 14.329 MHz Sunday nights at 0100 GMT. The other Apple nets are more or less local nets; you'll probably need to be within 700 miles of their net control to receive them. They are:

- West Coast Apple Net, Net Control WA6SZC, Mickey Hicks, 4301 Garnsey Lane, Bakersfield, CA 93309. Meets EVERY Saturday morning at 9 AM Pacific time on 7.230 MHz.
- East Coast Apple Computer Net, Net Control WA1UKZ, Dave Allen, 19 Damon Road, Scituate, MA 02066. Meets EVERY Saturday morning at 9 AM Eastern time on 7.260 MHz.
- The fourth Apple Net is just getting started. Net control is WDOGRC up in the Dakotas, which meets EVERY Wednesday night at 7 PM his local time on 7.260 MHz.

Anyone wishing to start another Apple Computer net at a different time, day, or location is sure welcome to do so. Many of our members have regular times set up to meet their Apple friends on ham radio. It takes a very good radio to receive the ham radio frequencies; one with the required selectivity to separate all of the signals heard. If you don't have a radio, please don't buy one without first contacting one of us or another ham. You could make a very expensive mistake and purchase what you think is a good radio, but which is not suited for ham radio.

Any Hams reading this who would like to set up a meeting with me to just rag chew about the Apple, drop me a line or 'phone me (see the masthead page in this issue) and we can switch over from Ma Bell to Ham Radio. One sidelight to the Apple Computer Net is our public domain exchange library, Apple Avocation Alliance, 721 Pike Street, Cheyenne, WY 82001. It has more than 2,000 programs so far.

Let's leave our Apples for a while and explain in some detail about obtaining an Amateur Radio License from the Federal Communications Commission. As I said earlier, you need the license only if you wish to **transmit**. Anyone can **receive** with no license at all.

There are five different classes of Amateur Radio licenses; Novice, Technician, General, Advanced, and Extra. The higher you do in your license, the more privileges you are given by the FCC. Did you know you can send and receive a form of TV with your Apple? (Oops. . . I said let's leave the Apples for a while, didn't I?)

The license most people start with is Novice. The requirements for the novice license are: To be able to send "CW" (Continuous Wave, or Morse Code) at five words per minute; and to know very basic radio theory. You don't have to go to the FCC office to obtain a Novice license; any ham with a General or higher license may administer the Novice exam. If you don't know a ham in your area, contact me and I'll try my best to put you in contact with someone in your area.

And how would you learn the Morse Code? Well, we're back to the Apple. Send me a disk with a return envelope and I'll be glad to send you a group of public domain programs that teach you the Code with sight and sound, on your Apple. How long will it take to learn code at five WPM? One week (7 days), 90 minutes a day will more than do it. Break those 90 minutes down into 4 different periods each day. Don't try to do it all at once, and don't skip a day.

One week from when you start, you should be ready to take your code test. By the way, if you give the code program I send you to the Ham who is going to give you the test, he may give you the code test using the Apple to generate the code. The Ham will send in the FCC form you have filled out, and in a few weeks he will receive your written test. Use those few weeks to study basic radio theory. There are several good books on basic theory; your local Ham or I can help you find them.

I did have hopes of being able to supply basic Ham theory on a disk, but that disk isn't done. (Actually, it's not even started.) If any person or group does have Novice theory on a disk, please send it to me and I'll make sure it gets on the same disk that the code is on.

There is a Question and Answer book that gives samples of what you'll find on the FCC Amateur Novice exam. It's available from the American Radio Relay League, 225 Main Street, Newington, CT 06111. Ask for the "Novice Q & A Book". Include \$2 U.S., \$2.50 elsewhere. The ARRL also publishes a magazine called **QST**, devoted entirely to Amateur Radio. Cost is \$25 for 12 issues, same address. **QST** has articles directed at all levels of Hams, from Novice to Extra, and plenty of advertising, for new and used ham equipment.

After the Ham examiner sends in your written test, you may receive a notice in about two weeks that you failed. If nothing comes in about three weeks, you can start to breathe more easily, because if you have passed, it takes about 6 weeks for you to get your license. If you follow my instructions, 95 percent of you will pass and receive your licenses. To those other 5 percent, who know

it all, well, join me. It took me three tries to get my Novice license. Y'see, I'd study code for 30 minutes one day and then skip two or three days, study for another 20 minutes and skip a day. Then I'd wonder why I couldn't pass the darn code test. To those of you who are going to say you're too old, too young, too busy, too lazy, too anything to get your ham license, I say that this is why Ham Radio is so great: only those who are willing to put out some effort will get the license. Did you ever receive something for nothing that was worth anything?

There is no cost for the Novice license. It's good for 5 years and may be renewed. With your Novice license, you may contact just about the whole world. You will be learning about Ham radio procedures and increasing your code speed. You'll also be having a great deal of fun.

The next step up the Ham ladder is Technician. For this one, you must take a tougher written test on ham radio theory, but the code

speed requirement remains 5 WPM. If you know radio and 5 WPM code, you could go directly to Technician, skipping Novice. Tests for Technician and up are only given at FCC offices.

After Technician comes the General class. This one has the same level of difficulty as the Technician in the theory test, but the code requirement is higher; it's 13 WPM.

Next is the Advanced class license. Now the written test starts to get hard; ask me, I've failed it four times. But that's because I'm using Jim's "I don't need to study" way; instead of studying, I just wish. **(Well, maybe the time Jim consumes with his Apple and IAC responsibilities has something to do with having little time to study. . . —PCW)** As I said before, nothing comes for nothing; someday I'll wise up. The code requirement for Advanced is the same as for General.

At the top is the Extra class. The written test must have been created by an engineering Ph. D., and the code requirements are 20 WPM. Whew!

Each time you upgrade your license the FCC gives you a larger range of frequencies to use, and permits you to use some of the more exotic ways of communication. Of course, there is some snob appeal in being able to say that you have an Extra Class License. (I should have that problem!)

But you don't need that extra class license to get started using ham radio to increase the enjoyment of your Apple, so it's not as difficult as you may have thought, is it? With a General license, you can make contacts around the world with other hams; exchange programs and information via ham radio, and send and receive slow scan TV using your Apple and ham transceiver.

So we complete the circle; Apple owners using ham radio to help them enjoy ham radio. Check it out, and you'll agree that Ham 'n' Apples is a great combination. With luck, we'll meet soon, on the air.

Until then, "73".

THE INSPECTOR

These utilities enable the user to examine data both in the Apple's memory and on disks. Simple commands allow scanning through RAM and ROM memory as well as reading, displaying and changing data on disk.

Read and rewrite sections of Random Access files. Reconstruct a blown VTOC. Weed out unwanted control characters in CATALOG listings. UNDELETE deleted files or programs. Repair files that have erroneous data. All without being under program control. and more.....

You may transfer sectors between disks. This allows you to transfer DOS from one disk to another thereby saving a blown disk when all that's blown is DOS itself; or to restore a portion of a blown disk from its backup disk.

Its unique NIBBLE read routine provides a Hi-Res graphical representation of the data on any track allowing you to immediately ascertain whether your disk is 13 sector or 16 sector. Get an I/O error...is it because you have the wrong DOS up? is it because of a bad address field? or a bad data field? or because a track was erased? This will allow you to tell in an instant without blowing away any program in memory.

APPLE DISK & MEMORY UTILITY

- Repairs Blown Disks
- Reads Nibbles
- Maps Disk Space
- Searches Disks
- Searches Memory
- Edits Disk Sectors
- Outputs Screen to Printer
- Displays Memory In HEX/ASCII

The INSPECTOR even lets you search through an entire disk or through on-board memory for the appearance of a string. Now you can easily add lower case to your programs (with LCA).

Do you want to add so-called illegal line numbers into your program? or have several of the same line numbers in a program (like the professional programmers do)? or input unavailable commands (like HIMEM to Integer Basic)? or put quotation marks into PRINT statements? Here's the easy way to do them all!

AND MORE

The INSPECTOR provides a USER exit that will interface your own subroutines with those of the INSPECTOR itself. For example, just put a screen dump routine (sample included in documentation) at HEX 0300 and press CTRL-Z. The contents of the screen page will print to your printer.

ROM RESIDENT ROUTINES

The INSPECTOR utilities come on an easily installed EPROM. This makes them always available for instant use. No need to load a disk and run a program.

FULLY DOCUMENTED

Unlike other software of its kind, The INSPECTOR comes with an EASY to understand manual and reference card. Examples and graphics help even the uninitiated use the power of these utilities. And furthermore, we offer the kind of personal service which you have never experienced from a software vendor before.

See your LOCAL DEALER OR . . .
Mastercard or Visa users call TOLL FREE 1-800-835-2246. Kansas residents call 1-800-362-2421. Or send \$49.95. Illinois residents add \$3 sales tax.

SYSTEM REQUIREMENTS

All Apple II configurations that have access to Integer Basic (either in ROM or RAM) will support The INSPECTOR. Just place the chip in empty socket D8 either on the mother board or in an Integer firmware card. Apple II+ systems with RAM expansion boards or language systems will receive the INSPECTOR on disk to merge and load with INTBASIC.

And...if you have an Apple II+, without either RAM or ROM access to Integer Basic, you will still be able to use The INSPECTOR because we are making available 16k RAM expansion boards at a very affordable price. Not only will you be able to use The INSPECTOR, but you will also have access to Integer Basic and other languages. Our price for BOTH the INSPECTOR and our 16k RAM board is \$169.95, less than most RAM boards alone. Call our office for details.

APPLE TELECOMMUNICATIONS

An Inexpensive and Efficient Approach

by Louis H. Millrad

The problem was simple enough, but the solution appeared costly. The result which I was endeavouring to achieve was the ability to implement my Apple, which was to remain resident at my home, into my legal practice without the expense of acquiring a second computer. The initial application which I had in mind consisted primarily of maintaining a diary and appointment calendar as well as recording time charges for my clients by way of some form of data base management. It was also my intention eventually to incorporate part of my bookkeeping and accounting functions on the computer.

My system configuration was fairly simple: a 48K Apple II Plus, Integer Card, two disk drives, and a D. C. Hayes Micromodem. Up until a couple of months ago, my appointment calendar, consisting of day-to-day appointments, reminders, etc., was maintained manually in my office, and entered into the Apple each evening after arriving home. This was followed by hard copy printouts on an almost daily basis, which were kept at my office for access by either my secretary or myself. Needless to say, the system was cumbersome and less than suitable, for it only provided my schedule for the immediate future (probably no more than two or three weeks in advance at any one time), and there was always the element that it was not completely up to date. Any changes or additions were entered manually, and of course, due to my schedule changing two or three times a week with new appointments and cancella-

tions, there was the continual problem of keeping my calendar current. It became quite evident that more immediate accessibility was required than what was available at the time.

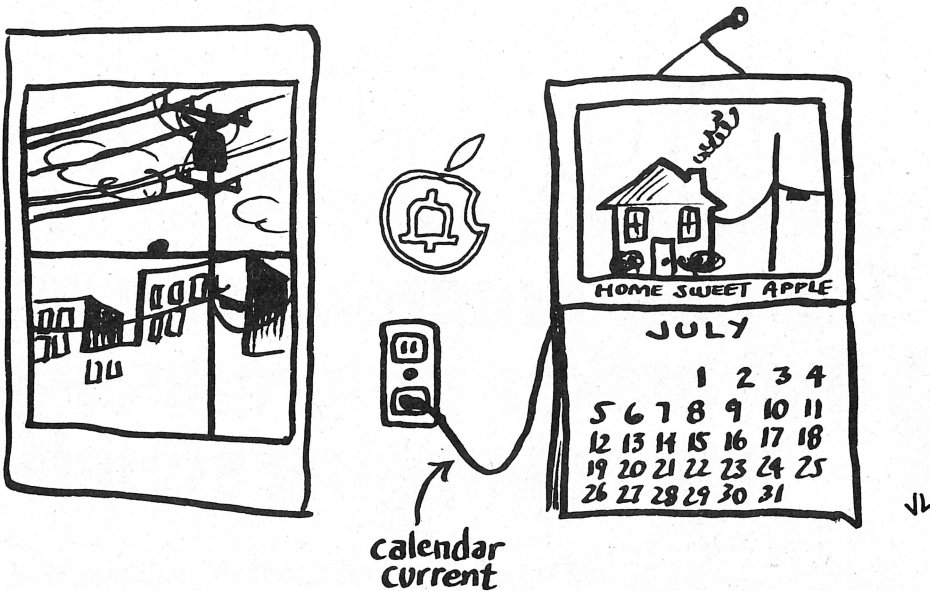

The problem might very well have been overcome by removing the entire system to my office. Of course, this had many drawbacks, the main one of which was the inability to work on or play around with (probably the latter more so than the former) my system in the evening or on weekends when I had available time at home. There was also the practical difficulty of disrupting my family life, turning my wife into a computer widow and my children into computer orphans.

In assessing the elements of a practical solution to this problem, two courses of action became apparent to me. The first would have been to acquire a second Apple, thereby duplicating the expense already incurred in my system configuration. There were certain advantages to this approach in that I would be able to run virtually any program on either unit, and would not be restricted with graphics transmission and other telecommunication difficulties. The cost, however, was a major factor in persuading me that this would not be the preferable route to follow. A second solution then came to mind which would cost me virtually nothing to try out; and if in fact it worked, would be a reasonably economical approach to accomplishing my goal.

I was using a DEC LA34 as my printer. Although the speed is somewhat limited to 300 baud maximum, the quality of the unit as a printer in that price range was more than attractive; the price was in fact quite instrumental in my determination to acquire it. There was also an added advantage which I had not bargained for: not only was the DEC-writer able to serve as a printer, but its design capability included the fact that it was an RS 232 hardcopy terminal. The unit is quite transportable, being really not much larger (and certainly lighter) than an IBM Selectric.

Rather delighted with my reasoning, I transported the unit down to my office in anticipation of being able to control my Apple remotely; I envisaged drawing upon the multitude of programs that I had available which were quite useful to my practice and, more importantly, having available an immediate hard copy printout. Just imagine how a client would be impressed if, after discussing a proposed financing deal, I could provide him almost immediately with a printout comparing the advantages and disadvantages of leasing as opposed to outright purchase; or even to furnish a complete amortization schedule! If I could draw upon this information immediately, there it would be in black and white for the client and myself to assess.

Similarly, my calendar was readily accessible. This gave me greater flexibility than the normal

diary that one keeps in an office, for it would extend beyond the calendar year. In theory, I could diarize years ahead and therefore advise a client of the date and time of our meeting and give him a hardcopy reminder; or notify him through a reminder system of the date of maturity of his mortgage or likewise perhaps notify him of a court date. At the same time, I would be able to incorporate periodic reminders and follow-up items for myself. When I started thinking about it, the applications were virtually limitless.

All of my time and charges could be recorded over the telephone lines, and when it came time to bill a client I could call up the file, get a printout of the dates, time spent, charges, disbursements and the like; and to have all this information immediately accessible so that in theory all I would have to do is hand it over to my secretary so she could type it out in final form. As well, we could concurrently start running the bookkeeping function on the computer.

I had already invested in the cost of the terminal, so there would only be one further expense, namely the cost of a modem. With dollars in hand, I immediately rushed to my local supplier, purchased a Cat modem, took it back to the office and connected the RS 232 cable to the terminal. I plugged it into the wall, turned it on, dialed my home number, put the receiver in the cradle and waited . . . and waited . . . and waited.

Nothing happened! I had forgotten to incorporate an auto-answer

routine onto disk. I frantically called home and (verbally) instructed my wife to key in the auto-answer program for the D. C. Hayes. Upon calling back, I was delighted to see my DEC print out the usual "Hello" program with some additional garbage. This was quickly remedied by playing around with the DIP switches so that the duplex, parity, etc. were all properly set; the whole process took approximately ten minutes. I then took the Apple through a series of routines starting with the old favorite of CATALOG, re-booting, running, listing, stopping list, etc. It worked beautifully!

In order to have the system function properly, it was necessary for me to incorporate the auto-answer program as my Hello program on Disk 1; it was also necessary to remove all graphics applications from my programs so that, for example, INVERSE and FLASH became NORMAL video. The system functions exceptionally well, but for the occasional "hang", which occurs primarily in any program having a graphic application not yet removed. Fortunately, there is someone home at all times, so this merely necessitates having to re-boot the system; the frequency, however, is greatly diminished and most of the glitches have now been eliminated.

Now for a seemingly happy ending. For merely the cost of a modem, I am able to use it in my practice on an almost hourly basis while at the same time I have its full capability available to me in the evening and on weekends. I am currently toying with the idea of con-

verting my programs to Pascal; it will be interesting to see what effect, if any, the Language Card will have on the system or what effect expanding the number of drives might have. With two drives, there has not yet been a problem of accessibility. With the availability of DOS 3.3 and increased storage on disk, no further disk drives have been necessary, in the short run at least.

It is interesting to note that in order to exit the system in a hurry, I merely hang up the receiver at my office. Subsequently, when re-entering the system, because of the auto-answer mode, the system will answer at the same point as when exited. (The auto-answer program is furnished in hard copy by D. C. Hayes as part of its manual.)

There is one difficulty, that of being without a printer at home. I propose overcoming this particular setback by acquiring a used hardcopy terminal such as a Texas Instrument Silent 700, or a Teletype, having a minimum of 300 baud. Maybe in the short term, I'll just rent a terminal from one of the many suppliers in the marketplace.

From a strictly business point of view, I find this particular configuration to work, and work rather well. For me it fulfills the two most important criteria, efficiency and economy, which is what it's all about.

Louis H. Milrad is a Toronto Barrister and Solicitor, whose practice has been evolving to include more clients with computer interests since he purchased an Apple II some four years ago. The computer has become a family affair; his wife, Elaine, is enrolled in the Computer Science program at York University for her own professional advancement. Mr. Milrad is also President of Apple-Can, the 350-member Apple user group based in Toronto, but having a nationwide membership and affiliations. His interest was and is in developing special interest groups within Apple-Can. The **Apple Orchard** masthead discloses his latest appointment, that of Special Interest Group Co-ordinator for the IAC.

DATA COMMUNICATION

by Rob Stewart
from The Harvest

Data Communication! It sounds interesting, but what kind of data, why would I want it, what can it do for me, where can I get it, and most importantly, what does it cost?

By "data communication", I mean the transfer of information between one location and another. It need not be two computers, but it is generally at least one. (Obviously, there are several different and more precise definitions, but this one will serve us quite well.) The transfer of data is conducted with the aid of Ma Bell, over existing dial-up telephone lines. To perform this transfer, your computer must be given a voice; one that it and any other computer can understand, provided they speak the same language, the same dialect, and don't have an accent problem.

The "voice" is called a MODEM, for MODulator/DEModulator. This unit translates computer information, 1's and 0's, into little spurts of certain frequencies; and conveys these chirps and squeaks into the 'phone line. You can hear a version of this kind of data transfer if you have a cassette recorder hooked up to your Apple. The speed with which the modem can send and receive this noise is called its BAUD RATE. Now, you want to know what a "baud" is. A simple explanation is that it's a measure of transmission speed; 300 Baud is at least 300 bits per second, which is a little more than 30 characters per second. (A full explanation is more complicated, and neither you nor I need that here.)

The link between modems isn't that difficult; being basically stupid, modems need to know constantly if there is another modem on the line. To fulfill this need to know, the originating modem sends out a certain CARRIER tone, telling the other

modem that somebody's here, and will be transmitting. The responding modem returns with its own carrier. If either carrier is ever missing from the line, then the communication link has been lost and must be re-established.

Once you have a communications link established, you have to worry about the language and the dialect. The standard 'language' for data communication is the American Standard Code for Information Interchange (ASCII), although some companies use other standard or custom-made languages. (The 'language' is just an agreement that an "A" is an "A" and not a "B".) Each letter, number, and symbol has its own code.

The "accent" has to do with the frequencies that the modem uses. Modems are set up both to transmit and receive data. If the modem can receive and transmit at the same time, it's called FULL DUPLEX. When using full duplex, you do not see what you type as you type it. Rather, you wait for the other system to receive and send back the character that it received, for your inspection and verification.

If the modem can only transmit or receive at one time, it's called HALF DUPLEX. In half duplex, your system prints the outgoing character, without verification; you have no turnaround of characters from the other end. Why would you want to use the half duplex mode? Half duplex is useful when sending large blocks of data, because the data transfer rate is much faster if the verification is eliminated. However, if you are sending large amounts of data, more than one character at a time (half duplex), then you need to know such things as "I got your first record", or "got your second record, but wait before send-

ing another"; "are you there?"; "goodbye", etc. This is called PROTOCOL. Protocol is used mainly on larger computer systems when transmitting vast amounts of data. There are now few uses (but the number is growing) for protocols in the mini-computer field. The most notable current example is transmission of programs from one system to another.

When using half duplex mode, the modems manage the 'phone line in such a way that only one modem is transmitting at a time. This is done by looking for a CARRIER signal. When your computer wishes to send some data, it informs the modem by a signal called Request to Send (RTS). The modem then checks to see if carrier is present on the 'phone line. If there is carrier present, that means another modem is preparing to transmit. If no carrier is present, your modem turns on its carrier to get control of the 'phone line. It then

returns a signal to the computer called Clear to Send (CTS). Then and only then will your computer ship out its data. One of the advantages of half duplex is that any number of modems may be connected to the same 'phone line, because only one modem is sending at a time.

In general, full duplex is used for human interface where transmission of one character at a time is desired. Half duplex is used when blocks of data are being sent between computer and computer.

In full duplex mode, if the transmit and receive frequencies were the same, then the modem would be talking to itself. Not very effective, but sometimes useful for testing the modem. Modems communicate using pairs of frequencies. Modem 1 will transmit on Frequency A and receive on Frequency B. To have communication, Modem 1 must transmit on Frequency B and receive on Frequency A. This is called ORIGINATE MODE and ANSWER MODE.

If all you are doing is sending one character at a time (full duplex), then dialect won't be a problem. If there is a problem with a block of data, the protocol mechanism is designed to test and recover or re-send the bad block of data until it is received properly.

What kind of data? In the beginning there were only programs available for transferring from one system to another. This has gradually changed. Now there are appearing around the country systems which will download a program to you either for free or at some reasonable (or perhaps unreasonable) price. These programs, the ones you pay for, are usually less expensive than similar programs in the local stores, because of the lack of documentation, packaging, and overhead costs that are included in the standard distribution network. The lack of documentation means that these programs must be "self-documenting". If there is no charge, then you get what you pay for, but most people don't intentionally program in a confusing manner.

We are now beginning to see the first glimmer of the uses of home data base communication. There are now several large and varied data bases available to individuals who a 300 Baud modem. Some of the things which are available are current stock prices and stock histories,

airline flights and reservations, wire service news bulletins, sports info, gold and money prices, personal banking. . . the list could go on and on, and it's growing constantly. So if you want something that isn't around yet, just wait a few months. . . or get together with a couple of people and develop it. Most of these data bases aren't sold; rather, access to the information is rented. **The Source** and **Micronet** are two examples of the large timesharing companies which feature large on-line data bases. For access to these "computer utility" services, you pay some type of subscription fee, and then a connect charge or time charge each time you use the service.

A "do it yourself" kind of home data communication is the computer Bulletin Board System (BBS). This is a system with the necessary software and hardware, that will answer the telephone and allow you to access the files of the system. These files are messages that have been posted by other people, in much the same way as messages are posted on a regular bulletin board. Subjects cover a wide variety of interests. You won't generally see any that are lewd, crude, or abusive, because the system operators remove those if they appear. You can learn a number of very interesting things from read-

ing the messages on these systems, and your local computer store will be happy to show you what the BBS systems are like.

What does it cost? There are two basic ways to accomplish data communication. The first is with a full feature modem such as the D. C. Hayes Micromodem. You can plug it into the Apple, and directly into a 'phone line jack after you have notified Ma Bell that you are doing so. The unit is direct-wire connected, and does its own dialing and telephone answering. See the directions that come with the hardware.

The second way is with an acoustic coupler-type modem driven by the Apple through its Serial Interface card. The acoustic coupler is the one where you dial the number yourself, and then place the telephone receiver in a rubber cradle to put the Apple on the line.

Both methods will wind up costing about \$450. I went the Micromodem route because it's more convenient. As yet, I know of no full-feature modem for the Apple which will communicate at 1200 Baud. 300 Baud is fine for people, but it is very slow for massive data transfer.

Consider joining the home data communications revolution; it IS happening right now, with or without you.

CAN I SPEAK TO YOU... ALONE?

The Evan's Report Is In There – Somewhere!

The old-fashioned mess of paper filing systems can drive you over the edge. You waste time and money in inefficient searching and manual sorting. In today's business environment, this is both outdated and unnecessary.

DATADEX, the information organization system from IUS, hands you your valuable information immediately – when you need it from your APPLE II desktop computer.

You view your stored information on the APPLE™ screen or create reports with simple commands. DATADEX provides just the detailed and professional looking reports needed in today's business world.

With DATADEX, management performance is improved using faster, more accessible information and, best of all, DATADEX has been shown to pay for itself in two months of normal secretarial time. Visit your local dealer and experience DATADEX yourself. IUS, 281 Arlington Ave., Berkeley, CA 94707 (415) 525-9452.

Product Reviews

UNITEXT

Text display module—with lower case

Reviewer: Steve Lloyd

From: Dockside Computing, P.O. Box 5030, Westlake Village, CA 91362

Like many other Apple users, I have always been disappointed by the Apple's inability to display lower case letters. Sure, there have been lots of ways to get around this short-coming, but up until now there hasn't been anything that met my few, simple, requirements.

I was looking for something that is very simple to operate. I like the idea of making some simple changes to DOS and possibly some of the larger application programs; and I don't want to have to do something special every time I want to use lower case.

I was also looking for a character set that is easy to read. True lower case descenders without crowding any of the characters is a must. For my own use, the looks of a character set don't make all that much difference; however, like many other Apple owners, I'm not the only one who uses the Apple. Wife, children, mother-in-law, cats, dogs, and the occasional frog all have access to it. It's tiring to explain to all of them that that funny-looking squiggle is suppose to be a "g". (Try telling that to a

frog sometime; they just don't listen.)

Finally, I was looking for something that is easy to install, not things like "just cut this trace, run these jumpers, solder here, and change these few integrated circuits..." I have more respect for my Apple than that.

All of my expectations seem to have been met by a product called "UniText". The manufacturer, Dockside Computing, calls it a universal text display module for the Apple, and it comes very close to being exactly that. The device consists of a small printed circuit board with several chip extenders. Installation requires a #1 Phillips screwdriver (and a small soldering iron if you want to make the optional shift key modification described below). The changes required are very easy to make and can be accomplished in less than a half hour.

The UniText package includes the lower case adapter, documentation, and a disk of Pascal and BASIC demonstration programs. The documentation is very well done, 26 pages of extremely detailed information on the installation, operation, and software interfacing of UniText. Much of this is repeated in the tutorial demo program on the disk which allows you to see UniText in action after it is installed.

The character font is excellent, requiring no squinting and no explanation (not even to the frog), and as good as any 7 x 8 dot matrix character can be. It contains all of the ASCII characters including true lowercase

descenders and all of the special characters. Since UniText is EPROM-based, a whole new set of characters could be designed by using a reprogrammed EPROM.

With a shift key modification, the Apple will recognize the shift key for all of the alphabetic (A..Z) characters of the keyboard. It requires one solder connection to the underside of the keyboard; the longest part of the job is heating up the iron. UniText also supports a Ctrl-Q shift lock feature in case you don't want to modify your Apple and void your warranty.

The cost of UniText (about \$80) is a bit high when compared to similar devices on the market, but the real test is the cost/benefit ratio. That is something everyone will have to calculate for himself/herself.

I tested UniText with several text editors (Apple Writer, The Correspondent, Language system) and found excellent results with all of them. It performs well in BASIC as well as Pascall II.1 (it doesn't work with Pascal I.1, but that's coming soon). Use of UniText with the language system gives a whole new dimension to word processing with the built-in editor. Frankly, I'm impressed.

In summary, UniText provides lower case display on the Apple 40-column screen. Installation is very easy; less than a half-hour. It has a crisp, clear font with true descenders. Use with a variety of software products is very easy and produces excellent results.

**Tic, Tic, Tic,—Turn On Light
Tic, Tic, Tic,—Start Coffee—
Tic, Tic, Tic,—Turn On Radio—
Tic, Tic, Tic,—Turn Off Sprinklers**

Reviewer: Ken Silverman

From Thunderware, Inc., P.O. Box 13322, Oakland, CA 94661

Here, without the need for any additional plug-in peripherals, is a clock which also can control a BSR/X-10 controller. Thunderclock Plus (tm) by Thunderware is a two-peripheral system on one card.

The clock portion keeps track of the time with an accuracy of .001%, and can be accessed by your programs very easily. The month, day (and day of the week), hour (AM/PM), minute and second can be obtained. The only drawback I found was the lack of the year. Other features include 24 hour format if needed, and an on board battery to keep the clock running when the Apple's power is off. Typical battery life, according to the spec sheet, is 3 to 4 years.

The Plus portion allows the control of a BSR/X-10 via an ultrasonic transducer connected to the clock board. You can, with the "scheduler" software, available thru Thunderware, completely control the BSR. It can schedule events daily, weekly, or monthly, even at specific dates and times. It allows you to DIM/BRIGHT your lights at 128 levels and for any duration. This can all be done in the "background" while you are using your Apple for other work. You have use of good interrupt rates with a resolution of $\frac{1}{2048}$ th of a second, for those who might wish to write a multitasking program.

One of the newer items of interest dealing with this clock is that it will work in and with the Apple III computer as well as the Apple II. Since there is no longer (or, more correctly, since there never really was) a clock chip included with the Apple III, here is one of the first peripherals for that larger computer.

Thunderware also makes available a Pascal disk to interface the clock and BSR with your Pascal programs. I can't give any direct feedback on how well it works with Pascal because I have no experience with that language. The cost of the package, including clock board, X-10 interface option, and Scheduler software, is \$189.00.

ABM (ANTI-BALLISTIC MISSILE)

Defend the East Coast from otherwise certain destruction!

Reviewer: John Dyscedeye

From the Muse Company, 330 N. Charles St., Baltimore, MD 21201

ABM, in Defense jargon, means Anti-Ballistic Missile, and you are commanding the Coastal Defense forces as they respond to enemy attack. Your sector runs from Boston to Richmond, and all of these cities come under nuclear missile attack by an unnamed enemy. Your mission is to position the incoming missiles in the target crosshairs and fire your ABM's to blow the invaders out of the sky.

(Whoops—there goes Philadelphia!)

Using a joystick, there's nothing to it, almost. Using the paddles, you find that with one controlling vertical and the other controlling horizontal motion, it gets a bit cumbersome.

(Hmmm . . . just lost Richmond.)

The enemy attack intensifies as the game proceeds, and then there's the dreaded MIRV missile which splits into multiple warheads. The trick is to destroy the missiles before the MIRV might split.

(Oh darn, not Boston too!)

As long as one city remains intact, you're still in the game. And when the last city is destroyed, your score is based on the number of missiles you were able to destroy before that unhappy event.

(Well, Baltimore went . . . no more Muse.)

This is a good Hi-res representation, with fireballs and explosions, and it does have a good "feel" about it. The best review actually came from the young members of the San Francisco Apple Core. When we demonstrated this program, among others, at a recent meeting, it was ABM that the folks requested we leave up "just a little longer".

I'm sure it was the program's quality rather than West Coast smugness that caused the favorable reception. This one is worth having, as an example of a "state-of-the-art" Hi-res computer game.

**WHAT'S THE DIFFERENCE
BETWEEN AN APPLE II AND
AN APPLE II PLUS?**

The only difference between the Apple II and the Apple II Plus is that the Apple II has Integer BASIC and the "old" Monitor ROM while the Apple II Plus has Applesoft BASIC and the Auto-start monitor ROM. Most of the game programs available today are written in Integer BASIC, while most of the business, scientific, and industrial programs require Applesoft. The selection depends on your application. Apple offers firmware cards that will supply whichever BASIC your machine does not have. Another approach involves use of the Language Card; the DOS 3.3 System Master and BASICS diskettes will load the "other" BASIC as part of the system boot process.

★ ★ ★

**I'M HAVING TROUBLE WITH
INTERMITTENT OPERATION
OF A PERIPHERAL.**

That could be due to a number of reasons, but the problem usually comes about because of some imperfect electrical connection in a cable or a peripheral card slot. Occasionally, peripheral cards in the Apple collect some oxidation on the contact fingers which can cause an intermittent connection. This can result in various system errors.

To clean off contacts, remove the card. (ALWAYS TURN OFF THE POWER BEFORE TOUCHING ANYTHING INSIDE THE APPLE!) Using a soft pencil eraser ("Pink Pearl" or such), gently clean off the contacts. Replace the boards, seat firmly, then reboot the system. If this does not correct the problem, contact your dealer for assistance.

PRICE WAR

by Joe Budge

As microcomputers grow in popularity, their uses wander far afield from the original hobby hackers. Two prevalent applications on Apples today are business management and computer-based education. While these fields would seem to hold little in common, a joining occurs in the realm of business education. Business students these days must learn computing to survive. With one or several Apples installed, a business school soon ponders how the Apples might be used to aid in courses unrelated to computer literacy. This article describes the use of an Apple-based computer simulation in teaching microeconomics. Bear in mind that business students spend whole semesters studying the subject, so what follows is necessarily simplified.

Simply put, microeconomics is the study of market forces acting on a single firm. The most common problem is price setting. What prices should a company set on its products to be most profitable? To answer that question, one must know the relationships between price and sales volume, production volume and cost, volume and profit, and the various interactions with one's competitors. Just to say that fewer people buy at higher prices is not good enough. Price is as quantitative a measure as you'll ever see, for a price is a number. Anything short of numerical derivation is merely hand waving. Hand waving results in what economists enjoy calling "sub-optimal conditions," so we seek numerical ways to solve the pricing problem.

Two equations characterize price and profit behavior: the demand equation and the cost equation. The demand equation relates all relevant variables to the volume of sales.

These can be the price itself, market share, other market prices, advertising levels, seasonal cycles, and so forth. Gross revenues equal calculated sales demand times the set price. The cost equation relates production volume and cost. Most commonly a fixed cost per unit is simply multiplied by the sales volume to give total cost. Additional factors to consider include overhead and economies of scale. Total profits are, of course, the difference between revenues and total costs.

A thorough understanding of the equations involved requires diligent study of hundreds of equations, graphs, and examples. After a few months of this, business students tend to lose track of their real objective, learning price behavior. The equations become an end in themselves. At this point, perspective must be restored. The Price War simulation is a tool which helps accomplish this.

The simulation pits teams of students against each other in a price war as they try to maximize team profits. Ever since the oil embargo, schools have had to stop giving their students gas stations to practice price wars with. The easiest alternative, one which doesn't involve real money, is computer simulation. A computer can solve demand and cost equations easily and more quickly than occurs in real life. Thus a useful lesson can be driven home in one class period.

To play Price War, the students are given some basic information about the simulation. They know how many teams will participate, what the demand equation is, and that the manufacturing cost of each unit sold is \$5.00. The demand equation appears in line 2520 of the program list-

ing. The demand equation is set so that a team's unit sales increase if the team had high market share in the previous period or had a low price relative to other teams this period. This means the team must constantly trade off sales volume against sales revenue while guessing what the other teams will do.

The simulation begins with the instructor entering the number of teams and the number of periods for the session. Teams disclose their prices in writing before each period. Once the instructor enters these prices, the Apple calculates the results for that period and goes on to the next. At the end of the game the winning team is announced and the printer can list a game summary.

With enough teams playing, prices soon converge to match the \$5.00 unit cost. Price cutting gets bad enough that teams attempt to minimize losses instead of maximizing profits. With a known number of periods, teams can also try for market share early and plan on cleaning up with a big price hike at the end. Once these strategies have been demonstrated by one team, all the others follow. Then the simulation becomes as boring as watching sheep graze. To provide education and entertainment, Price War incorporates two features. First, a randomizer changes the actual number of periods to fall within three of the desired number. Thus no one really knows when the game will end. Second, the simulation includes a government which is just as fickle as our own.

The Government and its capabilities are kept a secret until actually invoked by the instructor. This does a good job of showing how laws or other adverse factors can whistle out

of nowhere to strike the unprepared at any time. No indication of the Government is given in the program displays until the Government has already done something. The instructor may invoke Government whenever "press return to continue." appears on the screen. Return will indeed allow the program to continue, but several one-letter commands will bring in the Government. Government laws and their single letter commands are as follows:

A—Antitrust. If one team is gobbling up market share, the Government can slap an antitrust restriction on the entire industry. The antitrust laws will prohibit any one team from selling more than a specified number of units. The instructor supplies that number upon the program's prompt.

I—Inflation. With the money presses rolling, the Government causes cost inflation at a rate set by the instructor. See how fast prices can be adapted if the students are awake and learn what "cost-push" inflation is all about.

P—Price Controls. Under price controls, teams are prohibited from changing their prices by more than a certain amount during any one period. As with other Government actions, the amount is supplied by the instructor. As with real life, price controls can be very nasty when coupled with inflation.

X—Ends the game on the spot for product obsolescence.

Any other keyboard character sent to the Government will elicit a list of the Edicts available for the benefit of the absent-minded.

A sample program run (Figure 1) accompanies this article to illustrate a simple one-period price war. After entering five teams and one period, the instructor had his first chance to play government. Having a poor memory, he hit "?", not an Edict, to get a list of those available. This lets the cat out of the bag as far as the students are concerned, for they have a clue what might happen later. At any rate, the instructor enters an "I" to set inflation at 20 percent before proceeding with the simulation. After setting inflation the instructor could

have asked to issue another Edict, but chose to press "Return" instead. Then he obtained and entered the team pricing information.

Once pricing data was entered, the Apple calculated and displayed the results. Note that only invoked Edicts were shown. The cost was shown only because inflation changed at this point to play government again. However, since the simulation was finished the price war ended instead, giving a summary of the profit and market share winners. After the game a summary of results for each period could have been printed out had that option been elected by typing "Y" in response to the question "Summarize game to printer (Y/N)?"

A complete listing of Price War accompanies this article. The program was written in Applesoft on an Apple II. A minimum of 32K of memory is required. A printer is needed to summarize the simulation results. The printer interface card is assumed to be in slot 1. The slot number can be changed by substituting the appropriate number in program line 3110. As the program prints in 40-column format, no adjustment is necessary to accommodate parallel interface cards.

I would like to acknowledge Wes Magat of the Fuqua School of Business of Duke University for his assistance and suggestions with the economics of Price War.

While earning an M.A. in Anatomy, Joe Budge worked as a teaching assistant for classes of undergraduate and medical students. His business experience comes from several years as a stockbroker. In 1977 he adopted an Apple II and became a born-again hobby hacker. In addition to serving his second term as Secretary of the IAC, Joe is President of the Carolina Apple Core in Raleigh/Durham, NC. At the moment he is starting his second year of the MBA program at Duke and just finished a summer marketing internship with Apple Computer. Contrary to popular opinion, Bill Budge is not related to him.

NEW...FOR APPLE II⁽¹⁾

FROM PROMETHEUS

VERSACard

1. Serial Input/Output Interface
2. Parallel Output Interface
3. Precision Clock/Calendar
4. BSR Control

ALL ON ONE CARD

with true simultaneous operation
...at a down-to-earth price!

CHECK THESE FEATURES: True simultaneous operation! VERSACard's unique hardware selection circuitry makes your Apple "think" that separate cards are installed. This allows VERSACard interface ports to be compatible with existing software such as APPLE PASCAL, Microsoft Softcard⁽²⁾, and most other Apple software.

The Serial Input/Output port is RS-232C standard. Features include accurate crystal controlled baud rates, half/full duplex operation, and interrupt capability.

The versatile **Parallel Output Interface** is configured for the Centronics standard and is easily configured for other standards. Firmware is available to utilize the graphic features of popular printers such as the Epson.

Precision Clock/Calendar. All standard real-time clock/calendar functions. One second to 99 years time keeping. Battery back-up supplied.

BSR Control. Add an ultrasonic transducer or the Prometheus Direct Connect Option and VERSACard provides you with BSR remote control. By utilizing the on-

board real-time clock and the Prometheus Time and Event Scheduler — you can remotely control various accessories in your home and office.

VERSACard is shipped complete with SOFTWARE for each function contained in an industry standard EPROM. Versatile device drivers permit connection to virtually any standard peripheral. The Prometheus engineering staff is available to help you with any peripheral and special device interface problems. Call us, we'd like to talk with you.

VERSACard — the only Apple peripheral card you're likely to ever need!

Order: PP-VCD-1 VERSACard @ \$249.00 each.

Compare Key Features	VERSACard	CPS MultiFunction Card
Parallel, Serial and Realtime Clock Interfaces?	YES	YES
BSR Control Interface?	YES	NO
Compatible w/ Apple Pascal?	YES	NO. Special Pascal disk required.
Compatible with CP/M?	YES	NO. Special CP/M disk required.

ATTACH-BIOS CONSOLE DRIVER

by Steve Lloyd
San Francisco Apple Core

I. INTRODUCTION TO ATTACH-BIOS

Since the release of Apple II Pascal 1.1, there has been a great amount of interest in the internal workings of the Basic Input Output System (BIOS) and how to modify BIOS to provide software interfaces for non-Apple hardware. Many devices that used to work with the original Pascal do not operate at all under the new system. The problem is that when Apple changed the BIOS to accommodate the new memory use conventions, they used some locations that were previously idle. This led to competition between the operating system and hardware drivers memory usage. In most of the cases, both sides lost and the system crashed.

In April, Apple released through the International Apple Core for distribution to member clubs, documentation which describes the internal workings of the BIOS and the philosophy which has become the standard for all interaction between the BIOS and other portions of the system. Apple also included a program which will attach user provided drivers to the BIOS when ever the system is booted. This eliminates the annoying requirement of having to run a specific patch program before a device can be used.

The documentation, depending on how it is formatted, is almost 50 pages long. It includes language program listings. Written by Barry Haynes at Apple, it is a reasonably complete compilation of the facts and figures needed to write and attach machine language drivers for version 1.1 of the language system. A word of warning, Barry specifically states that this documentation is not meant to be a tutorial or even a users manual for any part of the language

system. It is intended to be used by experienced assembly language system programmers to assist in attaching software drivers for non-Apple I/O devices.

II. SYSTEM CAPABILITIES

When Apple created version 1.1 of the language system, a number of enhancements were made to extend the capabilities of the system. The more significant of these enhancements are listed below.

- 1) 16 user defineable devices
- 2) system device drivers can be redefined
- 3) multiple units can use the same driver
- 4) multiple drivers can access the same unit
- 5) any user defined driver can be initialized at system initialization
- 6) device drivers are loaded without interference to normal operation

The exact configuration of the system drivers is completely up to the implementor. The driver designs are restricted by only a very few rules that govern how the drivers interface with the rest of the system. In general, Apple has restricted the BIOS access to a well defined set of addresses and procedures. Other methods may work, but they will not be supported by Apple either now or in the future. Apple is attempting to make these interfaces constant and still retain the freedom to make other changes necessary for system evolution. This position is well stated in section II.10 of the documentation.

III. CONSOLE: DRIVER

The Apple II has always been lacking in its display screen capabilities.

Although the 40x24 display is serviceable, it places a great restriction on the word processing capabilities of the language system editor. Several months ago, I attempted to solve this problem by purchasing one of the available 80 column display boards.

Plugging this card into slot #3 of the Apple and turning on the power brought the language system up with the 80 column board hooked into the system as the console device. The first thing I noticed was that the monitor had to be radically misaligned to show a barely usable display. This was caused by a hardware design error which has since been corrected. The problems that remain are in the firmware and are the subject of this section.

The features that are missing from the firmware are listed below.

- a. the type-ahead buffer would not function
- b. the stop, flush, and break keyboard functions were not implemented
- c. the shift key modification was not supported.

Additionally, the shift lock capabilities provided were less than useful. (Capitalizing a letter required 5 key strokes.)

The console driver shown in listing 1 is a first attempt at resolving these problems. Although it still doesn't provide the flush and break keyboard functions, it does correct the other deficiencies in the firmware. This driver also redefines some of the keys to provide left and right curly brackets (useful for Pascal comments) and the underscore. It also produces an audible click whenever a key is pressed. The exact capabilities are outlined in listing 1.

The console is one of the more difficult device drivers to implement. The console is the default device for all system messages and command lines. This makes using the console for debugging the driver very difficult. For this reason, I have adopted the "one step at a time" approach for developing this system driver. By taking the shell program shown in listing 2 and adding incremental functions to it, the bugs in the driver are easily pin-pointed.

The documentation suggests a 6 step process for implementing a driver.

1. write the machine language driver
2. assemble the driver
3. execute the program ATTACHUD
4. execute the program LIBRARY
5. cold restart the system
6. test the driver.

Although it is not specifically stated in the documentation, as long as the .PROC name in the device driver and the interface requirements of the driver are not changed, the ATTACHUD program need be executed only once. This means that corrections, modifications and extensions to the driver can be made without having to re-explain the driver to the ATTACHUD program.

The process for linking drivers into their library (steps 4 and 5) is rather time consuming. It is very useful to put all of the repetitive, non-error producing portions into an EXEC file for automatic execution. Creation and use of EXEC files are explained in the Addendum to the Apple Pascal Operating System Reference Manual of the version 1.1 system documentation.

Using these techniques reduces the testing cycle to a 4 step process.

1. write the machine language driver
2. assemble the driver
3. EXEC/STEPS4&5
4. test the driver

A close examination of listing 1 reveals some of the options an implementor has. The first point to note is that listing 2 is actually imbedded in listing 1. This is because the shell was used as the starting point and a "one step at a time" technique was used to develop the driver.

The next point is that 3 of the 4 available driver enhancement options have been used. The code for the READ routine completely replaces the normal console read routine. The code of the WRITE and INIT routines is attached to the beginning of the normal console write and init routines. The normal console status routine has not been modified. The fourth driver enhancement option, the one not used in this driver, is to attach additional code to the end of the normal console routine.

The console is unlike any other character oriented device. It has five interfaces to the Run Time Support System, (the RTSP is the higher level pascal system which makes calls to the BIOS.) as opposed to the four interfaces normally associated with these drivers. The additional interface is the ConChk routine used to transfer characters to the type-ahead buffer as they are entered at the keyboard. It is also used to increment the random number seed.

IV. SYSTEM OPERATION WITH THE NEW DRIVER

In order to have the new console driver attached to the BIOS at boot time, the following files must be available on the boot disk.

- a. SYSTEM.ATTACH provided by the IAC to member clubs
- b. ATTACH.DRIVERS created by the LIBRARY program
- c. ATTACH.DATA created by the ATTACHUD program

During the boot process, after SYSTEM.APPLE has been loaded and before SYSTEM.STARTUP is executed, SYSTEM.ATTACH is executed. This program will load the driver from ATTACH.DRIVERS into the appropriate memory space indicated by ATTACH.DATA. The exact details are irrelevant, except to note that the new driver is attached before any user programs are loaded. Very simply this means that you can use either the new driver or the old driver, but you can't use both or even conveniently select which one you will use.

After the first user program has been executed, the system operates almost as it did before. The only exception discovered so far is that the system refuses to respond to initialize commands. This includes a system command line "I" and the initialize caused by some types of I/O errors.

V. CONCLUSION

The new capability to attach user written I/O drivers to the language system BIOS is a welcome addition. The interface specifications and philosophies presented in the Attach-BIOS documentation show a certain amount of creativity and far sightedness in the systems people at Apple. By providing this well defined capability, they have extended both the scope and the useful life of the Apple II and any other product that uses the language system.

LISTING I

```
; Console driver specification
;
; 0) designed to operate with a specific 80 column
;    display card
;    a. should work with other 80 column cards
;    b. will not work with 40 column APPLE screen
; 1) full upper and lower case keyboard
; 2) requires shift key wired to PB-2 on the game
;    I/O connector
```

```

; 3) provides caps lock
;   a. Ctrl-a enters caps lock mode
;   b. Ctrl-z leaves caps lock mode

INTEGER BASIC REGISTER LOADER

by Val. J. Golding

Much has been written of late concerning some rather interesting applications of the ampersand ('&') function in Applesoft. For example, see "Passing Argument Values to Machine Language Subroutines in Applesoft", by C. K. Mesztenyi in the Spring 1981 **Apple Orchard**. Integer BASIC has become sort of a neglected "poor cousin" recently. This is rather unfortunate. While Integer is not as powerful as Applesoft, lacking the latter's floating point and string manipulation capabilities, it is a much faster and easier BASIC for many programming applications.

This article and accompanying programs demonstrate that with just a smidgin of ingenuity, it is just as easy to pass parameters in Integer as in Applesoft. As a bonus, thanks to Don Williams of A.P.P.L.E., we are also able to present a little 15-byte subroutine which enables the Assembly program to determine its own location in memory.

The Integer BASIC program is simplicity itself. It serves as a front end; and, using the S. H. Lam routine, it serves as a method of loading the machine language along with the BASIC. The only hard and fast requirements are that the four variables in Line 100 be defined in the exact order shown, and with single-character names. The Assembly lan-

guage routine depends on this assumption.

Lines 120 to 150 assign actual values to the four predefined variables, with P representing the address of the routine the user wishes to CALL (in this example PRNTAX); the variables A, X, and Y are assigned the values to be loaded into the 6502's A, X, and Y registers. While they are static examples in the subject program, they could just as easily (and probably more practically) be handled as INPUTs, depending on the application.

The Assembly language portion is fully relocatable. To originate it at an alternate address, just change the (decimal) CALL in Line 200 to agree with whatever (hexadecimal) address you specify at the beginning of HEX\$.

The Assembly language program is self-modifying, meaning that certain code in the program will change the code in another part of the program. This practice is sometimes frowned upon as not being good programming technique, but there are cases when it sure is helpful.

The cause of all this consternation is the JSR FIND in Line 67 of the source listing, which on the surface appears to be a JSR TO \$0. In fact, this is the bit of code which gets modified, and ultimately will JSR to

the routine chosen by the user in the BASIC program. This creates the need for an indirect JSR in the instant program. Unfortunately, while the 6502 microprocessor provides indirect addressing for a JMP, the JSR instruction has only one addressing mode, and that is absolute.

Enter our current finaglement. The JSR to TRICK in Line 32 of the source listing is to \$FF58, per Line 20. However, any location which contained a \$60 (RTS) would serve the purpose. By doing the JSR, a return address is pushed onto the stack, so when we get back, by transferring the stack pointer to index register X in Line 33, we can now load the accumulator with the return address from the stack, and store it in \$00 and \$01. Then, loading Y with an offset to the location of the program we wish to modify, we use it as an index to store the data that will be loaded into the accumulator in Lines 42 and 45.

The balance of the program follows more easily; each significant location in the Integer BASIC variable table, in its turn, is loaded into the accumulator and then transferred to the desired registers. When this is done, we do the JSR FIND, which now contains a real address, restore the 6502 registers (we never checked in the first place to see if they had to be saved), and go back to BASIC.

```

APPLE PASCAL™

A HANDS-ON APPROACH

*Gives you everything you need to use
the most
powerful
language
your computer
can have.*

User-tested, step-by-step, A-to-Z approach features hands-on experiences in creating, running, and debugging programs. Volume is spiral-bound to lie flat by the keyboard while it takes you from basics to advanced programming and graphics applications. No math background is required. Only \$14.95. Order today — put the power of Pascal to work for you.

HOUSTON AREA APPLE USERS GROUP

THE APPLE BARREL

POORBOY WORD PROCESSOR— MX-80 LOWER CASE OUTPUT

by Mike Kramer
from The Apple Barrel
H. A. A. U. G.

The short program LISTed below is a combination of two capabilities which may be of interest to many of you. The first is a technique to print upper and lower case on an Epson MX-80 printer using keyboard input. The [ESC] key is used to indicate that the next character should be printed in upper case. The next character will appear on the screen in inverse video. An [ESC] must be typed for each upper case character. CTRL-E is recognized as an End command.

The "Input Anything" routine uses the GET command for input rather than INPUT. The main implication is that you can enter commas and colons without getting "?EXTRA IGNORED", etc. Provision is made for handling backspaces without backing off the edge of the screen.

REMs have been left out of the program to maximize speed. The following comments should help clarify what's going on.

Line 10—Initialize.

Line 20—Blank out line before reading in characters.

Line 30—GET a character, print to screen, no line feed, normal video.

Line 40—If a [RETURN] then go off to Print.

Line 50—If a CTRL-E then End.

Line 60—If a back space and no characters left, blank out line.

Line 70—If a back space and more than one character, then drop last character.

Line 80—Good character. Add it to the line to be Printed. Beep if < 75 characters.

Line 90—If an [ESC] set inverse video.

Line 100—Get another character.

Line 130—Prints a prompt and saves vertical cursor position. Goes to GET line.

Line 150—Turn on printer.

Line 170—Prepare for lower case letters.

Line 180—Loop through characters in line.

Line 200—If [ESC] then flag for upper case and look at next character.

Line 210—If not a letter do not try to print upper case.

Line 220—Print the character. If a letter and preceded by [ESC] then capitalize.

Line 250—Turn off printer.

Line 270—Go back for another line.

CAN I BROADCAST THE APPLE'S VIDEO OUTPUT ON A TV STATION?

The Apple II produces NTSC compatible video. However, it isn't NTSC standard video. The only way we know of to broadcast the Apple's video is to aim a camera at the video monitor. We don't know of anyone at this time who has successfully used a Time Base Corrector or modified the Apple to conform to NTSC. (If anyone has, please let us know.)

Let us acquaint you with MESSAGE-MAKING SOFTWARE. Just place the disk in the APPLE, enter the text, and colorful, dynamic messages appear on the screens of TV sets connected to the computer. Use the software to broadcast messages on TV screens in schools, hospitals, factories, store windows, exhibit booths, etc. The following program is our latest release:

SUPER MESSAGE: Creates messages in full-page "chunks". Each message allows statements of mixed typesizes, typesizes and colors, in mixed upper and lower case. Styles range from regular APPLE characters, up to double-size, double-width characters with a heavy, bold font. Six colors may be used for each different typestyle. Vertical and horizontal centering are available, and word-wrap is automatic. Users can chain pages together to make multi-page messages. Pages can be advanced manually or automatically. Multi-page messages can be stored to disc or recalled instantly.

REQUIRES 48K & ROM APPLESOFT \$ 50.

BONUS

SOFTWARE

SECTION

APPLE PLOTS YOUR DATA & KEEPS YOUR RECORDS TOO
APPLE DATA GRAPH 2.1: Plots up to 3 superImposed curves on the Hi-res Screen both the X & Y axes dimensioned. Each curve consists of up to 120 pieces of data. Graphs can be stored to disc and recalled immediately for updating. Up to 100 graphs can be stored on the same disc. Great for Stock-market Charting, Business Management, and Classroom Instruction!
 REQUIRES 48 K & ROM APPLESOFT \$ 40.

APPLE RECORD MANAGER: Allows complete files to be brought into memory so that record searches and manipulations are instantaneous. Records within any file can contain up to 20 fields, with user-defined headings. Information can be string or numeric. Users can browse thru files using page-forward, page-backward or random-search commands. Records can easily be searched, altered or sorted at will. Files can be stored on the same drive as the master program, or on another, if a second drive is available. Records or files can be printed, if desired. Additional modules coming are a STATISTICS INTERFACE, CHECKBOOK, MAILING LIST & DATA-ENTRY.
 REQUIRES 48K & ROM APPLESOFT \$ 35.

* All Software above on Disk for APPLE DOS 3.2, Convertible to 3.3

Before you show your program to anyone else, show it to Omega.

The others ask you to send a completed program, all the documentation, even a stamped envelope for them to ship the stuff back to you. They look at it, decide whether they can make a buck, and sign you up.

That approach isn't going to be good enough for the next generation of micro-software.

It's going to be more sophisticated. It's going to have to work for people who have no idea what goes on inside a computer. And each program is going to be the work of *many* people, instead of just one or two.

So we want to look at your program *before* you're finished with it. Our business and marketing people, our educators, our programmers can *help* you put together a better product. And then we'll help you sell it a different and better way.

Omega is going to lead this next generation of business, educational and utility software. We've got a good start on the utilities (our current best-sellers are The Locksmith and The Inspector).

And now we're starting on the others. If you've got a good idea, get in touch with us right away.

Did It Take a Golly-Gee-Whiz Demonstration To Get You Hooked On Apples?

Did you ever wonder who programmed that great looking feat? Until now, there's been just one person at Apple Computer creating programs for dealers to demonstrate. He even travelled to New York to set up the programs for Dick Cavett's Apple commercials.

Let's face it — our one person is swamped! And he's looking for the programming genius who can take part of the load off his shoulders. Maybe you've done some golly-gee-whiz things with your Apple, and you've been complimented on your computer creativity. If so, you could be Apple's next

Demonstration Programmer

You'll combine your programming abilities in PASCAL, Apple III BASIC and PILOT with input from dealers and sales and marketing people to design demo programs for all Apple products. Your artistic talents will be especially important for working with graphics and animation. And, of course, you should have the special people skills to communicate effectively with all the different types of individuals you'll work with. A Bachelor's Degree in Computer Science, Communications, Business, Psychology or a related field would be a big help.

Why not bring your love of Apple creativity to the source? When you do, you'll find your career moving ahead as fast as our astounding growth. Write today to **Stephanie Jensen at Apple Computer Inc., 10260 Bandley Drive, Cupertino, California 95014.**

equal opportunity employer

IF YOU ENJOY MUSIC, WHY JUST LISTEN?

You and your Apple could be making beautiful music together!

Join the thousands of Apple owners who are making music — without the years of practice needed for conventional instruments. You can quickly and easily enter a song from sheet music. Just follow the detailed examples and instructions provided.

THE PRODUCT. ALF's economical 9-voice Music Card MC1 is just \$195, the gourmet 3-voice Music Card MC16 is \$245 (use 2 for 6 voices or 3 for 9). Both come with detailed manual, complete software, and cable for connection to your stereo system.

THE SOFTWARE. We're convinced our product is by far the easiest to use and most versatile system for the Apple. You get many features not available in other systems, plus a very large note capacity. And no customer has ever reported a "bug" or error.

THE HARDWARE. ALF strives for the best quality possible. No MC1 card has ever been returned with a manufacturing defect.

THE COMPANY. ALF has been making computer-controlled synthesizers since 1975. We made the first music peripheral for the Apple — and it's still one of the most popular.

Available through Apple dealers, or write for more information.

WANT TO DUPLICATE DISKS QUICKLY?

ALF's disk duplication service has been a major source of quality reproduction for Apple-compatible software houses since 1980. Now you can use the same techniques for fast and accurate reproduction yourself, with ALF's Copy System. Why spend over \$10,000 for a duplication system when for just \$595 you can connect the ALF Copy System to your own Apple! Copying time is about 37 to 17.3 seconds, depending on number of drives used. That's over 1,600 disks in 8 hours from a single system. Are you completely confident of your present copying methods? At ALF, accurate reproduction is more important than speed. The ALF Copy System is designed to produce perfect copies every time.

Special hardware and software copies any standard 13 or 16 sector Apple format disk. Hardware plugs easily into computer — no permanent changes required. If you wish to do your own drive maintenance, the manual tells how to use standard Shugart procedures and accessories, and all necessary software is included.

Too busy to get into disk copying? You can still count on ALF's convenient copying service. Ask about our copy-resistant and "double boot" services too!

Write for complete details.

NEED CONVENIENT FLOPPY DISK PROTECTION?

ALF's Floppy Boxes are specially designed to offer great protection with more convenient use than other methods. They're designed with two layers of corrugated cardboard with a special "cross-grain" construction for extra strength. The standard square size holds 1-3 minifloppies for mailing or packing in products. The larger rectangular size holds minifloppies plus a standard 5 1/2 x 8 1/2 booklet (8 1/2 x 11 folded in half). Available with an adhesive closure tab for use as a mailer (just seal with tab, address other side, and mail). Software houses: write for details on attractive, protective packaging for your products.

Small quantity price is 75¢ for standard box.

Available singly at computer dealers, in large quantities from ALF. (New dealer inquiries invited.)

ALF PRODUCTS INC. 1448 ESTES DENVER, CO 80215

ASSEMBLER & TEXT EDITOR

Clone Software is proud to announce their new **Assembler** and **Text Editor** for the Apple® II computer (48K and two disk drives required). For an unbelievably low price of just **\$39.95**, you get BOTH a disk-based line-oriented text editor, and a 6502 Assembler! Since the text editor is a separate program, it can be used for other purposes than editing source code for the assembler. Specially designed for medium to large programs, this assembler also helps reduce debugging time through its **cross-reference** feature, which lists not only the value of each symbol, but also the number of each line which references it!

The Clone Assembler: documentation and 13-sector disk, \$39.95 from astute computer dealers or from Clone Software.

WE HAVE EVERYTHING YOU NEED FOR YOUR APPLE COMPUTER

NEW Breakthrough In Mass Storage!
Vista Dual 8" Subsystem

New Double Sided Double Density DMA Floppy Disk Subsystem For Your Apple II

- Features:**
- High speed DMA transfer of data (1 microsecond byte)
 - Complete documentation provided — includes theory of operation, source code for DOS enhancement utilities, schematics and diskette
 - Uses all standard Apple DOS commands (OPEN, CATALOG, LOCK, DELETE, LOAD, etc.) except for INIT which has been improved and enhanced in a Vista format routine.
 - Compatible with Apple DOS 3.2/3.3, Pascal 1.1 and CPM 2.2 (with the Z80 soft card by Microsoft)
 - 2K x 8 PROM contains Autoboot functions and all eight-inch floppy driver code allowing complete compatibility with Apple DOS 3.2/3.3
 - 120 days parts and labor warranty
 - Immediate delivery

- System Includes:**
- Vista V1000 subsystem w/case power supply & two QUME DATATRAK 8 Disk Drives
 - Vista A800 Quad Density DMA Disk Controller with software
 - 5-foot interconnecting cable (50 pin)

IAC MEMBERSHIP INFORMATION

The International Apple Core is a non-profit organization composed of Apple computer user groups throughout the world. Membership is available to user groups as Full Members, to companies and individuals as Sponsors, and to educational and charitable institutions as Associates. Details of memberships are described below.

The IAC was formed to disseminate all types of information from Apple clubs and the related computer industry. Our publication, the **Apple Orchard**, provides the latest and best information on a quarterly basis. Membership includes a subscription. Members also receive technical information in the form of Apnotes. These cover Apple Computers, related equipment, and related products from other manufacturers. Timely and fast-breaking news is covered in our monthly Bulletin.

FULL MEMBERSHIP

Apple user clubs are the principle reason for the IAC's existence today. We provide them many services beyond information dissemination. A newsletter exchange coordinator facilitates newsletter swapping between clubs. Our software librarian collects and distributes public domain software. Depending on the software's availability, new diskettes are sent out as frequently as once a month. We support special interest groups which our member clubs cannot: education, handicapped, medical, ham radio, and legal SIG's are examples. The **Orchard** publishes a complete list of our member clubs so that interested users may easily get

in touch. There is even a committee just to help new Apple clubs get started.

As a Full Member, your club will be able to participate in the election of IAC Directors. Directors provide an important link between member clubs and the IAC. As your representatives they set the IAC's policies and guide its administration. When schedules permit, the Directors and Officers are available to meet with clubs for personal input and exchange of ideas.

Full Membership is open to all Apple Computer User Groups. The combined initiation fee and annual dues will be \$50.00 (U.S.) for 1981. To enroll your club, simply return a completed application form with your first year's dues.

SPONSORS

Manufacturers having business related to Apple Computers need timely access to information that the IAC distributes. In addition many will seek access to the IAC membership for business interests, either to promote a product or to conduct market research. The Sponsoring membership is tailored to meet commercial interests.

In addition to the information sent to all members, Sponsors receive several benefits. Up to date mailing lists of our membership will be sent on request. Sponsors are given preferential placement of their advertising in the **Orchard**. Also, Sponsors are listed in each issue of the **Orchard**. Sponsors are welcome to participate in all the activities of the IAC, and are encouraged to explore

marketing potential with the IAC administration.

The Sponsoring membership is open to all corporations and individuals that wish it. The annual membership fee during 1981 has been set at \$200. Membership extends for a full 12 months.

ASSOCIATE MEMBERSHIPS

The Associate Membership was created to help educational, research, and charitable institutions that have an interest in Apple Computers but cannot join the IAC for financial reasons. Associate members receive only the printed materials sent to all members. If software and other additional IAC services are desired, the institution is encouraged to organize a user group which may apply for Full Membership.

The Associate Membership is open only to non-profit institutions at no cost. Membership applications must be accompanied by evidence that the institution is non-profit. If the membership will be care of an individual, evidence must be provided that the individual represents the entire institution to the IAC. Please submit whatever you feel is appropriate to demonstrate these requirements. Due to the diversity of institutions and countries, the IAC cannot set any fast rules. Associate Membership applications will be judged on their merit by the IAC President.

For information on becoming a member of IAC please write:

COMPU-LAW[®]

THE LAW OFFICE MANAGEMENT SYSTEM FOR THE APPLE II[®] COMPUTER

How fast can you get answers to these questions?

- *What are my critical dates for the next two weeks?*
- *Do we have any receivables over 30 days?*
- *Is Mr Jones' account current?*
- *How soon can you give me an analysis of my vacationing partner's case load?*

With COMPU-LAW the answer is "IMMEDIATELY".

COMPU-LAW is designed to make office management effortless, allowing lawyers to practice LAW.

IMPORTANT FEATURES:

Easy to Use/Menu Driven

In test sites temporary help was able to use the program with no training

Case and Matter Control

Step by step analysis of all actions taken in case or matters

Critical Dates

Lawyers will not miss important deadlines

Attorney's Billing Package

Invoices with as much detail as desired

Legal Memoranda and Form Management

Use with any 80 Column Word Processor

Computerized Expanded Rolodex™

Attorney Library Management

Open and Closed Files

The Text Solution for APPLE II®

Now APPLE II® Owners Can Solve Text Problems With VIDEOTERM 80 Column by 24 Line Video Display Utilizing 7 X 9 Dot Character Matrix

Perhaps the most annoying shortcoming of the Apple II® is its limitation of displaying only 40 columns by 24 lines of text, all in uppercase. At last, Apple II® owners have a reliable, trouble-free answer to their text display problem. VIDEOTERM generates a full 80 columns by 24 lines of text, in upper and lower case. Twice the number of characters as the standard Apple II® display. And by utilizing a 7 by 9 character matrix, lower case letters have true descenders. But this is only the start.

VIDEOTERM, MANUAL, SWITCHPLATE

7X12 MATRIX
18X80 OPTIONAL

7X9 MATRIX
24X80 STANDARD

VIDEOTERM

- BASICS** VIDEOTERM lists BASIC programs, both Integer and Applesoft, using the entire 80 columns. Without splitting keywords. Full editing capabilities are offered using the ESCape key sequences for cursor movement. With provision for stop/start text scrolling utilizing the standard Control-S entry. And simultaneous on-screen display of text being printed.
- Pascal** Installation of VIDEOTERM in slot 3 provides Pascal immediate control of the display since Pascal recognizes the board as a standard video display terminal and treats it as such. No changes are needed to Pascal's MISC.INFO or GOTOXY files, although customization directions are provided. All cursor control characters are identical to standard Pascal defaults.
- Other Boards** The new Microsoft Softcard™ is supported. So is the popular D. C. Hayes Micro-modem II™, utilizing customized PROM firmware available from VIDEX. The powerful EasyWriter™ Professional Word Processing System and other word processors are now compatible with VIDEOTERM. Or use the Mountain Hardware ROMWriter™ (or other PROM programmer) to generate your own custom character sets. Naturally, VIDEOTERM conforms to all Apple OEM guidelines, assurance that you will have no conflicts with current or future Apple II™ expansion boards.
- Advanced Hardware Design** VIDEOTERM's on-board asynchronous crystal clock ensures flicker-free character display. Only the size of the Pascal Language card, VIDEOTERM utilizes CMOS and low power consumption ICs, ensuring cool, reliable operation. All ICs are fully socketed for easy maintenance. Add to that 2K of on-board RAM, 50 or 60 Hz operation, and provision of power and input connectors for a light pen. Problems are designed out, not in.
- Available Options** The entire display may be altered to inverse video, displaying black characters on a white field. PROMs containing alternate character sets and graphic symbols are available from Videx. A switchplate option allows you to use the same video monitor for either the VIDEOTERM or the standard Apple II™ display, instantly changing displays by flipping a single toggle switch. The switchplate assembly inserts into one of the rear cut-outs in the Apple II™ case so that the toggle switch is readily accessible. And the Videx KEYBOARD ENHANCER can be installed, allowing upper and lower case character entry directly from your Apple II™ keyboard.
- Firmware** 1K of on-board ROM firmware controls all operation of the VIDEOTERM. No machine language patches are needed for normal VIDEOTERM use.

Firmware Version 2.0

Characters	7 x 9 matrix	Display	24 x 80 (full descenders)
Options	7 x 12 matrix option; Alternate user definable character set option; Inverse video option.		18 x 80 (7 x 12 matrix with full descenders)

Want to know more? Contact your local Apple dealer today for a demonstration. VIDEOTERM is available through your local dealer or direct from Videx in Corvallis, Oregon. Or send for the VIDEOTERM Owners Reference Manual and deduct the amount if you decide to purchase. Upgrade your Apple II™ to full terminal capabilities for half the cost of a terminal. VIDEOTERM. At last.

PRICE:

• VIDEOTERM includes manual \$345
• SWITCHPLATE \$ 19
• MANUAL refund with purchase \$ 19
• 7 x 12 CHARACTER SET \$ 39
• MICROMODEM FIRMWARE \$ 25

APPLE II® OWNERS!

introducing the KEYBOARD & DISPLAY ENHANCER

- PUT THE SHIFT AND SHIFT LOCK BACK WHERE IT BELONGS
- SEE REAL UPPER AND lower CASE ON THE SCREEN
- ACCESS ALL YOUR KEYBOARD ASCII CHARACTERS

Videx has the perfect companion for your word processor software; the **KEYBOARD AND DISPLAY ENHANCER**. Install the enhancer in your APPLE II and be typing in lower case just like a typewriter. If you want an upper case character, use the SHIFT key or the CTRL key for shift lock. Not only that, but you see upper and lower case on the screen as you type. Perfectly compatible with Apple Writer and other word processors like, for example, Super-Text.

If you want to program in BASIC, just put it back into the alpha lock mode; and you have the original keyboard back with a few im-

provements. Now you can enter those elusive 9 characters directly from the keyboard, or require the Control key to be pressed with the RESET to prevent accidental resets.

KEYBOARD AND DISPLAY ENHANCER is recommended for use with all revisions of the APPLE II. It includes 6 ICs, and EPROM and dip-switches mounted on a PC board, and a jumper cable. Easy installation, meaning no soldering or cutting traces. Alternate default modes are dip-switch selectable. You can even remap the keyboard, selecting an alternate character set, for custom applications.

PRICE • KDE-700 (REV. 7 or greater) \$129.
• KDE-000 (REV. 6 or less) \$129.

USER GROUP FORUM

conducted by Randy Fields

NOTE: The International Apple Core (IAC) receives many requests for information about starting and running Apple Users' Groups. I've asked Randy Fields to conduct this column to discuss many facets of Club activities in a practical way. Randy is Past President of the San Francisco Apple Core, and is the IAC's New Club Assistance Chairman. His sometimes painfully-won background in club policies, procedures, and practices is here for all of us; write if you have questions about Club matters.

—PCW

In the Summer issue of **Apple Orchard**, we discussed how an Apple Users Group (Club) is started and outlined many areas which form the foundation for a successful Club. This time, we'll cover one Club's approach to meetings, and some thoughts on governing of Club business.

First, meetings, as practiced by A.P.P.L.E.-Washington, based in Seattle. This Club is best known for its excellent publication, **Call-A.P.P.L.E.**, but their experience with meetings is no less valuable. Here's their report:

A.P.P.L.E. is a dual-purpose club: we are both a medium-sized local

club (400 members in a sprawling metropolitan area), and the largest international one (over 7,000 members in total). We've not done the best job in the area of local meetings, admittedly, having rotated them among local dealers—both because of the geographic area to be covered coupled with members' desires not to travel too far, and because we didn't have our own space.

We have had difficulty in finding both a format and the needed number of exciting presentations. We want to change this now that we have space for holding some (at least) of our meetings on our own turf. In preparation, we've been talking with other clubs about how they do their meetings, and find the following use-

ful ideas (many of which we are working to incorporate):

—your own space, at least for some meetings, where you can talk freely without offending the dealer host, where your hardware can stay set up, etc. Community colleges and larger high schools are one possibility if you can't swing your own space; a skill-tradeout with the host should make the idea acceptable to the school.

—a mix of scheduled speakers and informal (probably small-group) hands-on sessions. Some clubs meet twice monthly, alternating their format. Hands-on means hardware, so this is tied to the issue above.

- both a program chairperson who lines up speakers (or a committee to contribute wider contacts), and a detail/logistics person to make sure what needs to get done actually does.
- shameless raiding of local companies, the telecommunications nets, and visiting firemen for possible presentors. It helps if you can pay for periodic top speakers (at least travel expenses).
- investment in either a covey of monitors, or a projection TV system; the folks in the back get turned off quickly when they can't see the screen.
- a rule of "no game playing in the back" when the meeting is on, except during the "hands-on" sessions. The beep-beep from the latest shoot-em-up game in the hands of younger members is not only disruptive, it is damned rude.
- development of a wider sense of purpose; perhaps through community service projects, linkage to a school or students, etc. The ham radio operators have used this approach very successfully, why can't we?

The above is only a starter list. We hope to develop a forum for club discussion of these and other ideas. We'd like to hear what the very successful local clubs have been doing with meetings, together with the problems others are having.

CLUB GOVERNMENT

Two Percent for Ninety-Eight Percent. Now that we have your Club up and running, we will cover how the Club is governed. Since the club is formed around a tool for both business and pleasure (the Apple and/or other computers), some members will voluntarily supply the creativity to make the User Group a dynamic and interesting organization. (This creativity, if not channeled and managed, can also be the downfall of the Club.) Note: It is common in many volunteer organizations that 2 percent of the members do 98 percent of the work. However, the other

98 percent supply the money for the Club to carry out its activities.

In the Beginning. The way a Club sets policies, makes and implements decisions, and spends the members' money depends to a great extent on the size of the Club. The Founder and/or first President plus the first members play a crucial role in the Club's development and early growth by making the major decisions affecting how new members will be found, what general qualifications they should have, how much membership dues will be, etc., etc.

The "Nuclear" Club. If the Club has done the "advertising" for members effectively and by the time it has 25-50 members, the nucleus of the Club officers is present. Using a modified version of the San Francisco Apple Core's Bylaws, the following description of the President's and other officers' functions are provided. The traditional officers are: President, Vice President, Treasurer, and Secretary. Initially, the Founder is all of these. The next officer can be the Secretary/Treasurer. As the Club expands, the functions of the officers are split up. When and how they are split depends on the how much work there is to do, and how much time each of the officers have.

President. The President is the general manager and chief executive officer and has general supervision, direction and control of the organization and other officers. The President presides at all meetings of the members and at all governing meetings. The President has the general powers and duties of management usually vested in the office of President.

Vice President. In the absence or disability of the President, the Vice President performs all the duties of the President and, when so acting, has all the powers of, and be subject to all the restrictions upon, the President. The Vice President shall have such other powers and perform such other duties as from time to time may be prescribed by the President.

Secretary. The Secretary keeps a book of minutes of all meetings of members, the governing meetings and its committees, with the time and place of holding, the names of those present at governing meetings

and committee meetings, the number of members present, and the proceedings. The Secretary keeps the Constitution and Bylaws, as amended to date.

The Secretary gives notice of all meetings of the members and of the governing meetings and any committees, and shall have such other powers and perform such other duties as may be prescribed at the governing meetings.

Treasurer. The Treasurer is the chief financial officer and keeps and maintains adequate and correct accounts of the properties and business transactions of the corporation, and reports to the governing members such financial statements and reports as are required by law or for proper management. The books of account is open to inspection by any member at all times.

The Treasurer deposits all moneys and other valuables in the name and to the credit of the organization with such depositaries as may be designated at the governing meetings. The Treasurer disburses the funds as may be ordered at the governing meetings, renders to the President and the officers an account of all transactions and of the financial condition of the organization, and shall have such other powers and perform such other duties as may be prescribed at the governing meetings.

An example. If your Club grows at the rate of 5 new members per month (which is reasonable), your Club will have about 50 members at the end of the first year. Shortly after the Club is in operation, the Secretary/Treasurer starts the membership list and collects the dues. If the membership dues are \$25, the treasury will grow from \$0 to about \$1,000 before expenses. Once the second year starts, 10 membership renewals/month plus 10 new members effectively doubles the workload for the Secretary/Treasurer. This dynamic will probably elicit a "Wow, am I busy," and additional help will be requested. Depending on the desires of the President and Secretary/Treasurer, the job can be split into its two components, or a Membership Committee (of one or more people) can be formed.

Elections and Appointments. In the earliest stages of a Club's develop-

ment and growth, the officers may be appointed to their positions by the Founder and/or President. As the Club grows and more volunteers become active in its management, it is desirable to have the officers elected by a vote of the membership. Campaigns can be held, ballots with qualification statements can be given out or mailed to the membership, and majority's will can be served. If the Club continues to grow with many members outside the local area, the members can elect a Board of Directors who appoint the Club officers. When these various transitions take place depends on

the desires of the membership and the need for effective management.

All committee heads are appointed by the President and serve at the President's pleasure. There are: Standing committees and Special committees. Standing committees, such as: Membership, Newsletter and Library, perform the on-going tasks of the Club while Special committees such as: Election, New Meeting Place Location, and Special Equipment Acquisition, are appointed to carry out specific, intermittent assignments. When the need to get something done is perceived,

ask for volunteers, set up a committee, notify the members, and ask for a report at the next governing or general meeting.

Final observation on officers and management. Above it was noted that 2 percent of the members do 98 percent of the work. However, this 2 percent will do about 75 percent of the work that has to be done. Some volunteers will perform at 150 percent, others at 50 percent. Who will do how much at any given time is a semi-random function. But, take heart, all of the activities that NEED to be performed somehow get done.

INSIDE THE IAC

by Joe Budge
IAC Secretary

As scheduled, the IAC annual meeting was held in Chicago on May Second and Third. Representatives from member clubs came from as far away as Singapore to attend. The meeting began with an open forum discussion on copy protection. As might be expected, a variety of opinions were expressed by both users and manufacturers. It's clear that the issue is far from solved. Following the forum, Directors from each U.S. region were elected. Ballots from absent member clubs were combined with the floor vote to reach a determination. Jerry Vitt from the South and Bernie Urban from the East were the two incumbents re-elected to their posts. James Hassler was elected from the Northern region, and Jim Simpson was elected from the West. During the next day the IAC hosted a series of seminars on Apple-related subjects. To start the day, Apple showed their impressive multimedia slide show. Barry Yar-

koni, from Apple, followed with a report on the recent history of the Apple III, concluding with the announcement that the machine was debugged and operational. The two Steves spoke on their recent activities. John Couch, also from Apple, presented some of his thoughts and philosophies on the future of software development. Tom Woteki of Washington Apple Pi gave an informative explanation of Pascal from the beginner's standpoint, and Mark Pump of the Northwest Illinois Users Group did the same for DOS. Dick Switzer from Verbatim showed how disks are made and explained how they work. Vern Rayburn from Microsoft gave an excellent presentation covering CP/M on the Apple II. Phil Roybal, the closing speaker, excited everyone with his views on the computer revolution.

The IAC would like to thank all the speakers for the time and effort they put into their presentations. We

would also like to thank all the volunteers from NIAUG and the rest of the Northern region who made the whole weekend possible.

During the several months since the last issue of the Apple Orchard went to press, the IAC has sent several mailings to its member clubs. These are listed here:

- IAC software disks 6, 7, 8, and 9 were shipped.
- A set of Apnotes was sent in July.
- The Bulletin has been going out on a monthly basis.
- All clubs who were members at the time should have received the July Orchard (and this one).
- A packet of information containing pointers for writing for the Orchard.
- A listing of the IAC documentation library.

INTERNATIONAL APPLE CORE SPONSORING MEMBERS

IAC Sponsors are a special breed. They are the organizations who contribute to and support many IAC activities. In addition, they provide us application notes concerning their products—notes that show new and different ways to utilize the Sponsors' products with modifications for special purposes. When you consider a software or product purchase, give our sponsors special consideration; they have shown that they care about their customers.

"NIBBLE[®] IS TERRIFIC" (For Your Apple)

NIBBLE IS: *The Reference for Apple computing!*

NIBBLE IS: One of the Fastest Growing new Magazines in the Personal Computing Field.

NIBBLE IS: Providing Comprehensive, Useful and Instructive Programs for the Home, Small Business, and Entertainment.

NIBBLE IS: A Reference to Graphics, Games, Systems Programming Tips, Product News and Reviews, Hardware Construction Projects, and a host of other features.

NIBBLE IS: A magazine suitable for both the Beginner and the Advanced Programmer.

Each issue of NIBBLE features significant new Programs of Commercial Quality. Here's what some of our Readers say:

- "Certainly the best magazine on the Apple II"
- "Programs remarkably easy to enter"
- "Stimulating and Informative; So much so that this is the first computer magazine I've subscribed to!"
- "Impressed with the quality and content."
- "NIBBLE IS TERRIFIC!"

In coming issues, look for:

- Stocks and Commodities Charting
- Assembly Language Programming Column
- Pascal Programming Column
- Data Base Programs for Home and Business
- Personal Investment Analysis
- Electronic Secretary for Time Management
- The GIZMO Business Simulation Game

And many many more!

NIBBLE is focused completely on the Apple Computer systems.

Buy NIBBLE through your local Apple Dealer or subscribe now with the coupon below.

Try a NIBBLE!

INTERNATIONAL APPLE CORE MEMBER CLUB ROSTER

This roster of member clubs is directed primarily at **APPLE ORCHARD** readers who either currently don't belong to any Club, or who are looking for additional sources of information. The roster is arranged alphabetically by country and state/province. In addition, some clubs have a membership, publication and/or software services which go beyond local geographic boundaries. Readers may wish to contact these Clubs and request a sample newsletter. If you do, we recommend enclosing a check for two dollars to cover their postage and handling costs.

PUT YOUR APPLE TO WORK FOR YOU! WITH THE THUNDERCLOCK PLUS™

As an APPLE user you already know all the things your APPLE can do. Now Thunderware expands that list with the THUNDERCLOCK PLUS, the complete clock/calendar system for your APPLE! Your programs can read the month, date, day-of-week, hour, minute, and second in any of APPLE'S languages. On-board batteries keep your THUNDERCLOCK running accurately when your APPLE is off - for up to 4 years before battery replacement. But that's just the beginning.

The THUNDERCLOCK PLUS is the most useful and versatile peripheral you can put in your APPLE. It can keep your disk files organized by time-and-date-stamping them, it enhances the usability of many of the new business/professional software packages for accounting, filing, and time management, and it can remotely control lights and appliances for security or display purposes in your business or home.

SOFTWARE PRODUCT COMPATIBILITY

Many of today's important software packages for data-base management, business applications, communications, and time management are designed to use the THUNDERCLOCK PLUS. If you have or plan to purchase any of these packages, a THUNDERCLOCK will greatly enhance their usefulness.

●VISIDEX* (Personal Software) ●DB MASTER and MICRO-MEMO (Stoneware) ●MICRO-COURIER and MICRO-TELEGRAM (Microcom) ●THE CASHIER and THE STORE MANAGER (High Technology) ●BUSINESS PLUS and NET-WORKS (Advanced Data Systems) ...and many others!

DISK VOLUME 254		
*A 006 HELLO	07/07	16:37
*A 006 CLOCK	06/08	09:07

*A 003 SLOTFINDER	07/07	16:56
*A 014 DEMO	06/17	16:14

THUNDERWARE'S DOS-DATER

Our new DOS-DATER software upgrades the regular DOS on your disks so that DOS will use the THUNDERCLOCK to time-and-date-stamp disk files. Every time a program is saved or a file is modified, the current date and time to the minute are stored in the CATALOG with the file's name. You can tell at a glance when a program was saved or when any file was last modified. And this time/date stamping feature is completely automatic. That means any program which uses DOS will time/date stamp its files!

REMOTE CONTROL

Add Thunderware's X-10 INTERFACE OPTION to your THUNDERCLOCK PLUS and your APPLE can control lights and appliances through your BSR X-10 Home Control System on your pre-defined schedules. Our powerful SCHEDULER software allows you to create and modify schedules easily and execute them in the 'background', while using your APPLE for other tasks in the 'foreground'. Use your APPLE for energy management, display and security lighting, or laboratory/process control.

Our PASCAL Software lets you use all the THUNDERCLOCK'S features in PASCAL and sets the F)iler date whenever you boot.

You get all this versatility in just one peripheral system. Backed by a full one year warranty. See your APPLE dealer for a demonstration, or contact us for more information. We'll give your APPLE the best time around!

Suggested retail prices:

THUNDERCLOCK PLUS	\$139
X-10 INTERFACE OPTION	\$49
PASCAL SOFTWARE DISK	\$29
DOS-DATER/DEMO DISK	\$29
MANUALS ONLY, each	\$5

PRICE BREAKTHROUGH 16K RAM BOARDS FOR APPLE JUST \$129.95

HAVE YOU BEEN WAITING FOR THE COST OF EXPANSION BOARDS TO COME DOWN? YOUR WAIT IS OVER. UP UNTIL NOW RAM EXPANSION HAS COST AS MUCH AS \$195.00. NOW OMEGA MICROWARE IS PROUD TO ANNOUNCE THE ARRIVAL OF A TRULY AFFORDABLE EXPANSION CARD.

NOW YOU CAN RUN PASCAL, FORTRAN, 56K CPM WITH A Z80 SOFTCARD, INTEGER BASIC, APPLESOFT AND OTHER LANGUAGES ON YOUR APPLE. NOW YOU CAN INCREASE USUABLE MEMORY FOR VISICALC. NOW YOU DON'T HAVE TO PAY A FORTUNE TO HAVE ALL THIS.

AT \$129.95, OMEGA'S RAMEX 16 IS THE LOWEST PRICED CARD AVAILABLE TODAY.

WHAT DO YOU GIVE UP WHEN YOU PURCHASE THIS FIRST REALLY AFFORDABLE RAM EXPANSION CARD? WELL, YOU GIVE UP HAVING TO REMOVE ONE RAM CHIP FROM THE MOTHER BOARD OF YOUR APPLE. YOU GIVE UP HAVING TO STRAP A CABLE FROM THE CARD TO YOUR MOTHER BOARD. THAT'S IT. WHAT YOU GET IS A SIMPLE, RELIABLE, BOARD THAT JUST PLUGS IN. MEMORY REFRESH IS ACCOMPLISHED ON THE BOARD ITSELF.

THE RAMEX 16 IS GUARANTEED NOT JUST FOR 90 DAYS. NOT EVEN 6 MONTHS OUR WARRANTY IS FOR ONE FULL YEAR FROM DATE OF PURCHASE. WE WILL REPAIR OR REPLACE ANY BOARD THAT IS DEFECTIVE THROUGH MANUFACTURE FOR A PERIOD OF ONE YEAR AFTER PURCHASE PROVIDED THIS DAMAGE IS NOT USER INFLICTED.

ORDER YOUR RAMEX 16 NOW BY CALLING TOLL FREE 1-800-835-2246. KANSAS RESIDENTS CALL 1-800-362-2421. MASTERCARD OR VISA ACCEPTED OR SEND \$129.95. ILLINOIS RESIDENTS ADD \$7.80 SALES TAX.

KILL SURGES LIKE LIGHTNING!

AC power line surges are destructive, can cost you money, and can't be prevented. But you can stop them from reaching your sensitive electronic equipment with a Surge Sentry.

Surge Sentry acts in picoseconds to dissipate up to a 1,000,000 W, 100 μ second surge. Triggers at 10% above nominal peak voltage. Works in parallel with the power line. Is easy to install for immediate protection. No complicated wiring or special tools required.

Several different models to choose from, including an OEM version. Call or write today for a free brochure.

DEALER INQUIRIES INVITED

(continued on page 80)

SHAPE DEFINITION CONVERSION TABLE

by David G. Huffman
Call—A.P.P.L.E.

The necessity that mothered this invention was that of listing and debugging complex shape definitions destined for Apple's high resolution shape drawing routines. It is not designed for creating shape definitions, as there are several excellent commercial programs available that simplify the design of shape definitions, and there are also some in the literature, such as Mark Crosby's "Shaping up the Apple II" in *Apple Orchard*, 1 (1); pages 37-45.

However, once a shape definition has been created the result when DRAWn on the screen may not appear as intended. At this point, an examination of the hex codes in the shape definition would be appropriate, but converting these hex codes to moves is tedious, at best, using the Apple manuals. With this conversion table, one need only examine the hex codes of the shape definition from the monitor and look up the corresponding moves in this conversion table. The decimal equivalents are provided in case you are examining the shape definition from BASIC with PEEKs, or if you wish to POKE a short shape definition into memory from a BASIC program.

In the "Move" column are the moves that would be affected by the hi-res shape routines when a DRAW, XDRAW, or DRAW1 command is executed and the corresponding hex code is encountered in the next byte of the shape definition. The Move column should be read from left to right (A-B-C), with the first move corresponding to the first (right-most) three bits, the second move to the 2nd three bits and the third move (if non-printing) corresponding to the last (left-most) two bits of the hex byte.

All underlined moves refer to "printing moves", those that plot a point before moving. The non-underlined moves refer to non-printing

moves. Note that the third move in a byte must always be non-printing. For instance, there is no code for UL. If you wanted to produce this sequence, you would have to use UL (hex code \$18) and follow it with a byte beginning with L. Hex codes \$08 through \$3F correspond to bytes that contain two moves, and which are followed by a printing move which will always be the first move of the next byte. Note also that there are no bytes with two non-printing "up"s unless they are followed by a non-printing "right", "left", or "down". It should also be pointed out that hex codes \$01 through \$07* really involve only one move, that given in section A, because a non-printing "up" in section B will be ignored whenever the next move in sequence is a printing one (first move of the next byte). Hex code \$00** results in no moves, and is interpreted by the shape routines as "end of shape definition".

Probably the best way to use this table is to examine the hex codes from memory (making sure you are starting with the first byte of the shape definition, not the shape table index) and plot the corresponding moves on graph paper. When moving from one square to the next, shade the square in before leaving it behind if the current move is underlined, otherwise, just draw a line through the square.

In order for any shape definition to function with the hi-res shape routines, it must be preceded by a shape table index, formatted as outlined on page 95 of the Applesoft Reference Manual.

If your gray matter is really aching for some exercise, page 92 of the Applesoft Reference Manual explains some of the un-logic behind this bewildering array of exceptions.

ED-SCI STATISTICS

FOR THE PROFESSIONAL A COMPLETE STATISTICS AND DATA MANAGEMENT PACKAGE

Data Entry and Filing

- By Variable Name and Case Number
- One-Time Data Entry
- Easy and Rapid Editing
- Data Entry Worksheets

Data File Manipulation

- Add New Variables
- Add or Delete Case Values
- Create SUBFILES By User Defined SEARCH & SELECT Criteria
- Merge Files

Statistical Calculations

- Mean, Std. Dev., Std. Error
- Coefficient of Variation
- Frequency Distribution
- Unpaired t-Test
- Paired t-Test
- Mann-Whitney U Test
- Wilcoxon Paired Sample Test
- Chi-Square Test
- Linear Regression
- Correlation
- One-Way ANOVA with the Newman-Keuls Test
- Hard Copy of Data & Results

Statistical Calculations can be made on VISICALC* (DIF) and DATADEX * FILES. Graphic Plotting of all ED-SCI STATISTICS Data Files can be done with APPLE PLOT.*

Only \$95.00 brings you the ED-SCI STATISTICS instruction manual, the Master Program Disk, and a Back-Up Disk.

See ED-SCI STATISTICS at your local Apple Computer store. Dealer inquiries invited. For information please phone or write:

Ed-Sci Development

460 Beacon St. San Francisco, CA 94131 (415) 282-7020

ED-SCI STATISTICS requires an Apple II with the Applesoft or Language Card, or an Apple II+, 48K memory, and at least one disk drive with DOS 3.3 (16 sector).

INPUT/OUTPUT

The **Hayes Stack Smart** modem is an RS-232 compatible 300 baud data communications system for small computers. Features program control in any language, switch selectable options, full or half duplex and LED status indicators—\$279. Hayes Microcomputer Products, Inc., 5835A Peachtree Corners East, Norcross, GA 30092 (404) 449-8791.

Super Paddle consists of a high-precision linear potentiometer and a big industrial quality push button mounted in a sturdy 4 x 2 x 1 inch metal case which matches the Apple. Each of the two paddles is connected with a long 5-foot cable to the Apple game socket—\$39.95 plus \$2 postage and handling. Super Joy Stick uses the same circuitry that is used in the paddles and provides high precision—\$59.95 plus \$2 postage and handling. Peripherals Plus, 39 East Hanover Avenue, Morris Plains, NJ 07950 (201) 540-0445.

80-column card—**Doublevision**—offers new features for the 80 x 24 video display. Now available are hardware schematics and a completely commented source listing of software. Doublevision also includes a SYSGEN program to select type of cursor, monitor bandwidth and display of control characters. Doublevision is compatible with Z-80 SoftCard, Magic-Wand, Wordstar and Phoenix word processors, Programma International's Apple-Pie 2.0 and Information Unlimited's Easywriter Professional System—\$295. Computer Stop, 2545 West 237th Street, Suite L, Torrance, CA 90505 (213) 539-7670.

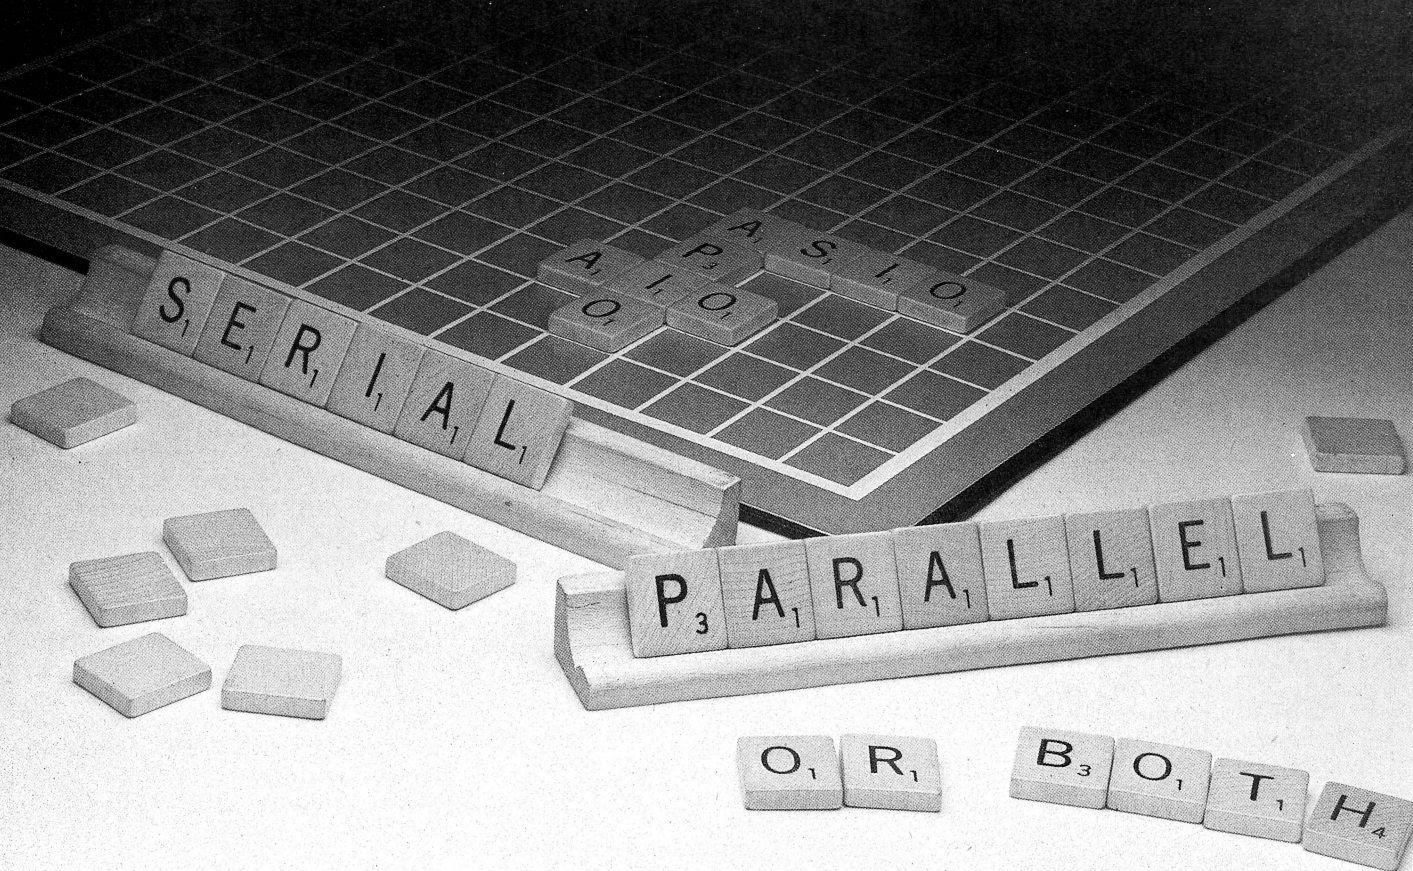

Hard Disk Drive family includes 5 1/4 inch 6 megabyte (unformatted) drive with a 450 5 1/4 floppy backup, controller and interface—\$4,850. 8 inch model

stores up to 10 megabytes with a 1 megabyte backup floppy—\$5,795. 14 inch model will store up to 58 megabytes each—price unavailable. Enhanced version of APPLEDOS permits you to build a data file as large as 16 megabytes. See your local dealer or contact Lobo Drives, Int'l, 354 South Fairview Avenue, Goleta, CA 93117 (805) 683-1576.

Remote I/O Board is a direct connection AC carrier communication interface designed to control and monitor remote devices thru existing AC power lines. Includes a battery backed-up CMOS real time clock. Allows software setting and reading of the clock and simulates the command console of a BSR controller. Two interrupt driven routines which are selectable by the user displays time on the screen and/or scans the timing table for control instructions. Foreground/background operation—\$185. Intelligent Control Systems, Inc., P.O. Box 14571, Minneapolis, MN 55414 (612) 699-4342.

Laboratory System for the Apple is designed to collect data from spectrophotometers, chromatography systems, pH meters, strip-chart recorders, and temperature controllers. Features 12-bit D/A and A/D converters with ranges of .5 to 4 volts differential input and automatic zeroing. Real time clock, interrupt circuitry, handshaking signals and TTL compatible signal levels. Quick I/O program makes it easy to write BASIC programs to control scientific instruments. Includes diskette, three cables, self-test adapter board, diagnostic software, two manuals—\$495. Interactive Microware, Inc., P.O. Box 771, State College, PA 16801 (814) 238-8294.

Type-'N-Talk is a new text-to-speech synthesizer from Votrax that can be connected to almost any computer. ASCII code from your keyboard is fed into the synthesizer producing speech. Contains 750 character buffer to hold the words

Apple* I/O Interfaces. SSM Spells Success Three Ways.

SSM helps you get the most from your Apple II* computer. Choose from three general purpose interface boards. With flexibility and prices that translate to big savings. Now, and when you upgrade.

Serial (ASIO™). Our ASIO gives you a full-duplex RS-232 interface. Plus jumper-selectable rates from 110 to 9600 baud. You also get software control, three handshaking lines and two output plugs—so you can connect your Apple to a modem or to a terminal/printer without modifying the cable.

Parallel (APIO™). For parallel interfaces, our APIO offers two 8-bit bidirectional ports. We also include additional interrupt and handshaking lines, plus software control of the interface configuration and data direction. Cables for Centronics and other printers are optional.

Or Both (AIO™). Choose our tried and proven AIO when you

need a sometimes-serial or a sometimes-parallel operation. This single-board solution packs a lot of performance for the price. Thousands are now being used. It even lets you operate both ways—simultaneously—under Pascal, or with special drivers.

All three boards feature powerful firmware so you don't have to write software to use them. The ASIO and AIO include cables.

Whether you're an OEM or end-user, we can supply virtually any quantity you need.

Quickly. Even in kit form. For the latest word on these, see your local computer dealer. Or call us today. You may also want to look into our cost-effective A488™ board which converts your Apple II into an IEEE-488 controller.

**SSM Microcomputer
Products, Inc.**

*SSM Microcomputer Products, Inc.,
2190 Paragon Drive, San Jose, CA
95131. (408) 946-7400. (TWX
910-338-2077. Telex 171171.)*

*Apple and Apple II are trademarks of Apple Computers Inc. ASIO, APIO, AIO and A488 are trademarks of SSM Microcomputer Products, Inc.

you've typed. Can be used online between a computer or modem and a terminal to speak all the data sent over the line. Utilizes standard RS-232 serial interface. One-watt audio amplifier, phoneme access modes, data switching capability, 75-9600 baud rate—\$375. Vodex, 500 Stephenson Highway, Troy, MI 48084 (313) 588-0341.

Eight-inch Floppy Disk Controller (the A800) enables Apple II users to access up to five megabytes of online storage through conventional disk operating system (DOS) commands. Provides high speed transfer of data from the drive directly to the Apple II memory without processor intervention. Compatible with the most popular disk operating systems for the Apple II. It also interfaces to all Shugart/ANSI Standard eight-inch floppy disk drives with complete IBM format compatibility in both single and double density modes—\$595. Vista Computer Company, 1317 E. Edinger Avenue, Santa Ana, CA 92705 (714) 953-0523 or (800) 854-8017.

Multifunction Card provides 1) calendar/clock functions from one second to 99 years—battery backed-up and compatible with MCI Apple Clock time access programs. Also features 2) parallel output with auto line-feed, Apple tabbing, line length, delay after carriage return, lower to upper case conversion, status bit handshaking. The other function 3) is a serial interface with transparent terminal mode, local echo, simultaneous serial and parallel output, 16 selectable baud rates, half/full duplex operation, RS-232 standard asynchronous/synchronous—\$239. Mountain Computer, Inc., 300 El Pueblo, Scotts Valley, CA 95066 (408) 438-6650.

A new **Disk Controller** for the Apple is completely software compatible with Apple DOS and contains 256 bytes of on-board boot ROM. Controls up to four 8 inch, single- or double-sided, single- or double-density disk drives with a total storage capacity of 4.4 Mbytes—\$699. Lobo Drives International, 354 S. Fairview Avenue, Goleta, CA 93117 (805) 683-1576.

Hi-Res Light Pen with full 280×192 resolution is now available. Compatibility with all available languages: Applesoft and Integer BASIC, FORTRAN, PASCAL, PILOT, FORTH, and CP/M. Usable in every screen mode of the Apple. High speed allows animation and true drawing. Uses video synchronization information to determine the instantaneous light pen location. Installs on Apple motherboard with low power consumption. Includes extensive documentation, manuals with numerous ex-

amples. Applications programs on diskette—\$285. Gibson Laboratories, Building 10, 406 Orange Blossom, Irvine, CA 92714 (714) 559-8727.

The **MCS-16 Microprocessor/controller** is a low-cost, interactive, acquisition/controller system. The system has 16 control ports, 16 digital and 15 analog data acquisition ports. Includes 256 channels of BSR capability. Operates from a game port on the Apple but also has RS-232 capabilities. It is programmed in a high-level language written for the Apple II. The program is compiled by the MCS-16 and then can operate independently or in background with the main computer. Energy management and biomedical monitoring and control are two areas that are a natural for this system. Has battery backup and a 7 day real time clock/calendar. i/e associates, Inc., 3702 East Lake Street, #202, Minneapolis, MN 55406 (612) 721-5066.

A new **Direct-Connect Telephone Modem** for use with Apple II and Apple II Plus microcomputers has been introduced by ESI LYNX. It is easy to install and use. It plugs into the peripheral slots and the telephone line without an acoustic coupler and is styled to match the Apple II. Features originate/answer, programmable word length, parity, number of stop bits, and full/half duplex. Optional at extra cost are auto-dial and auto-answer functions. Instruction manual lists free bulletin board telephone numbers and describes how to call these and other services, including the Source and Compu-Serve. One-year factory warranty—\$295.95. At your local dealer or ESI LYNX, 123 Locust Street, Lancaster, PA 17602 (717) 291-1116.

MEMORY

The **Saturn 32K RAM Board** for the Apple features on-board bank selection, write protect, switch selection of RAM board or motherboard ROM. Compatible with Microsoft's Z80 SoftCard, either DOS 3.2 or 3.3, Integer BASIC,

Applesoft, PASCAL, FORTRAN, LISA Ver 2, VisiCalc. 90 day warranty. Applications software includes relocation program for DOS, alternate language, making extra memory available to programs, etc.—\$239. Saturn Systems, Inc., P.O. Box 8050, Ann Arbor, MI 48107 (313) 665-6416.

MUSIC

Noisemaker II uses one General Instruments AY3-8910 Sound Chip with three tone generators, one envelope generator, one noise source, two 8-bit I/O ports. Applications vary from games and graphics, to aircraft and machine simulation to audible alarms. Also contains an audio amplifier, bread-board area. Create phasers, music, gunshots, "outer space" noises and more. Kit \$60. Assembled and tested \$79.95. Ackerman Digital Systems, Inc., 110 North York Road, Elmhurst, IL 60126 (312) 530-8992.

POWER CONDITIONING

Mayday, an uninterruptible power supply will handle up to 600 watts. Protects against power surges, sudden drops in voltage or disruption of power. Prices start at \$240 for the 150 watt system. Sun Research, Inc., Box 210, New Durham, NH 03855 (603) 859-7110.

PRINTER/PLOTTERS

Matrix Printer provides multiple character sets, letter quality printing. The **Malibu Dual-Mode 200** can perform high speed DP tasks at an efficient 165 to 200 characters per second and can produce letters of outstanding quality at speeds of 42 to 70 CPS as well. Expanded character sets, italics, gothic, greek/math at various pitches, graphics too—\$2,995. Malibu Electronics Corporation, 2301 Townsgate Road, West Lake Village, CA 91361 (805) 496-1990.

The **Bytewriter-1** is an **80-column Dot Matrix Printer** for under \$300! Uses a 7-wire print head with bi-directional printing at 60 lines per minute (80 cps) continuous. Utilizes a 96 character ASCII set with upper and lower case. Prints at 10 characters per inch plus expanded printing. Friction feed (synchronous), accepts single sheet or roll paper up to 9½ inches wide. Replacement heads are less than \$30. Prints original plus three copies—\$299. Microtek, Inc., 9514 Chesapeake Drive, San Diego, CA 92123 (714) 278-0633.

Epson MX-100 is a 15 inch wide **Matrix Printer** with letter quality printing and an ultra-high resolution bit image graphics capability. Up to 233 columns of data on 15 inch wide paper. Both a friction feed and fully adjustable, removable tractors. Priced under \$1,000. See your local Epson dealer or contact Epson America, Inc., 23844 Hawthorne Boulevard, Torrance, CA 90505 (213) 378-2220.

MISCELLANEOUS

Robot "Turtle" and Interface Card is available for the Apple II. The interface enables the user to conveniently control the turtle from a high level language (BASIC, Pascal, LOGO, etc.) via simple I/O statements. It can be used at home or in the classroom for teaching, learning or just having fun. Interface includes a parallel port, a separate regulated, current-limited power supply, and interface software. Turtle control commands include forward, back, right, left, eyes, pen, horn, tone, off, front touch sensor. Turtle \$399.95 kit, Interface \$199.95, Pascal software \$14.99. Terrapin, Inc., 678 Massachusetts Avenue #205, Cambridge, MA 02139 (617) 492-8816.

Three **Monitors** are available from **Amdek Corp.** The first is a 13 inch High Resolution Color monitor which is directly compatible with the Apple II. A peripheral board is available to interface the Apple II. 32 lbs. \$999 (pictured). A normal color monitor—compatible with the Apple II is 25.6 lbs. \$449. Also offered is a green phosphor monitor weighing only 17 lbs. with a 12 inch screen \$249. Amdek Corp. (formerly Leedex), 2420 E. Oakton Street, Suite "E", Arlington Heights, IL 60005 (312) 364-1180.

Software

BUSINESS

Electronic Stock Package for the Apple II includes password and programs for accessing the Dow Jones Stock Quote Reporter (contains more than 6000 daily stock prices). Current rates permit nightly updating of 30 stocks for about \$.50 per session. Downloading programs provide for auto dialing, logging on, retrieving daily data (prev. close, open, high, low, close, volume) for up to 200 stocks stored in easily edited file, disconnecting from system, and the writing of data to a single file on the user's disk. Data can then be displayed or printed. Conversion programs read this disk file, formats data (MD/Y/VOL/FNL), and automatically updates each individual stock file. Requires Apple II/II+, Applesoft, 48K, Disk, D. C. Hayes Micromodem II—\$80. Stock Market Utility programs provide for manual entry of stock data, correction of errors, stock splits, etc., comparative evaluation of stock performance, graphics hardcopy, conversion of data from Compuserve's MICROQUOTE financial data base. Demo included—fully compatible with **Electronic Stock Package**—\$59.95. H&H Scientific, 13507 Pendleton Street, Oxon Hill, MD 20022 (301) 292-3100.

The **PEAR System** is a portfolio record-keeping and reporting system for stock-brokers and other investment professionals. It is the first complete portfolio management system for the Apple which is designed with multiple portfolio recordkeeping in mind. Includes automatic pricing from Dow Jones, matching of proceeds and cost basis by tax lot, automatic adjustment of positions for stock splits, and fully formatted portfolio appraisal, unrealized gain and loss, realized gain and loss, and investment income reports. Features a full cross reference listing of client holdings by security. Complete documentation. Requires 48K, 2 floppy disk drives, 132 column printer, D. C. Hayes Micromodem (or Apple Communications Card on special order). Add on disk includes a VisiCalc interface and a multiple data disk cross reference capability—\$500. PEAR Systems, 27 Briar Brae Road, Stamford, CT 06903 (203) 322-5593.

BUSINESS/EDUCATION

Electronic Mail for the Apple is provided by **Micro-Courier** which allows rapid transmission of charts, graphs, correspondence, VisiCalc reports and

entire programs to other Apple computers over standard phone lines. Transmissions can be sent automatically allowing the owner to take advantage of low night phone rates. Micro-Courier can send 1,000 words of text in one minute for less than a quarter. A comparable TWX message would cost \$4.32—\$250. Micro-Telegram allows Apple owners to access Western Union Service, worldwide. Besides sending mailgrams, Apple owners can send and receive TWX, Telex, and international cables. Also allows access to Infomaster, the Western Union Data Base—\$250. Microcom, 89 State Street, Boston, MA 02109 (617) 367-6362.

Fast Facts was created and designed by a Certified Financial Planner for quick analysis of the personal investment planning needs of his clients. Operates very easily with single key program selection and printing commands. Includes planning for retirement, college financing, diversifying your investments, the result of inflation in devaluing your earnings, costs of borrowing money and loan balance at any point in time, investment calculations for compounding and with disk and printer (desirable)—\$95 includes disk and instructions. Richard Lorange and Associates, Ltd., 3336 N. 32nd Street, Suite 102, Phoenix, AZ 85018

AIDA: Apple Interactive Data Analysis is a new statistical analysis system. The program builds self-descriptive data files on the disk, then recalls variables by a "virtual memory" process as they are referenced by the user. Up to 11,000 data points may reside in memory at once, allowing a maximum of over 4,000 cases in analysis. Sub-setting, transformation, missing data and case weights are supported. Statistics include mean, variance, distributions, histograms, two-way tables (with Chi-square), Pearson and rank correlation, pair and standard t-tests, ANOVA, and multiple linear regression. Uses provisional means algorithms for accuracy of variances and cross-products, and computes significance levels. Data may be input from text files, or through an enter and verify routine. Users may modify program code or write their own "special" commands. Requires 48K with Applesoft ROM and one Disk II or Corvus—\$235. Action-Research Northwest, 11442 Marine View Drive, S. W., Seattle, WA 98146 (206) 244-9360.

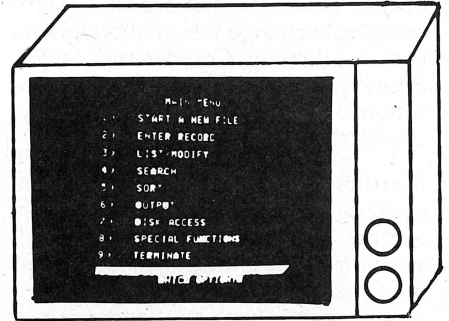

SOFTSWAP is a joint project of the San Mateo County Office of Education and Computer-Using Educators. Offers a collection of approximately 240 public domain instructional programs for the Apple, TRS-80, PET, Compucolor, and Atari. Most are short, stand-alone in-

INFORMATION MANAGEMENT

POWERFUL DATA MANAGER

- Versatile, user definable database can store data segmented by up to 35 fields.
- User oriented format is easy for the novice or professional to utilize. The use of menus, extensive prompting, single keystroke commands, and a universal escape capability allow anyone to store or retrieve information in seconds without errors.
- Machine language searches and sorts operate in a fraction of the time required by other programs.
 - Searches or sorts, subtotals or totals may be performed on any field at any time, not just on those that are indexed or specified in advance.
 - Search results may be displayed, printed, deleted, counted, totalled, edited, and/or saved to a new data file.

REPORT GENERATOR

OTHER FEATURES

- The sophisticated report generator allows you to format your data output in an infinite variety of ways.
- You can print form letters, columnar reports, lists, mailing labels, etc.
- Data, ratios or the results of calculations can be embedded anywhere in your letters or reports.
- The report generator gives your output the professional appearance that you require.

- You can append or merge up to a full disk of data files, or segment your data into separate files by a search key.
- Searches can contain up to 10 levels. You can search for a key word in any field, the absence of a keyword, or a number being within a specified range.
- Global editing of data may be performed.
- Arithmetic processing can be performed during record entry, edit, or output.
- Record entry, edit, or deletion (individual records or blocks) can be performed with no tedious delays waiting for disk accesses, index file updates, etc.
- Data may be stored on any number of floppy or hard disk drives.
- Data files can be reformatted at any time without reentering the data.
 - Backup disk for \$5.00.
- The package requires an Apple II plus or Apple II with Applesoft firmware, 48K RAM, at least one disk drive, and DOS 3.3.

SYNERGISTIC SOFTWARE

Retail Price will be \$220.00 effective September 1, 1981

Introductory price of \$150.00 available from June 1, 1981 through Sept. 1, 1981. Existing copies of the Modifiable Database may be returned (original disk and manual), with \$75.00 for the complete Data Reporter package. Order yours today!

Available from your local dealer or send check or money order to Synergistic Software, 5221 120 Avenue S.E., Bellevue, Washington 98006 or phone 206-226-3216.

Washington residents add 5.4% sales tax.
Apple is a trademark of Apple Computer, Inc.

structional units. Many are drill & practice exercises for the elementary school level or for remedial work at the secondary level. Each disk contains from 5 to 28 programs for various subjects and grade levels. Programs and disks may be copied without charge by visitors to the center. Purchase is available by mail at a cost of \$10 per disk or one SOFT-SWAP disk per original program (trade) on disk. Newsletter also available. \$1 for ordering/exchange information to Ann Lathrop, Library Coordinator, SOFT-SWAP, San Mateo County Office of Education, 333 Main Street, Redwood City, CA 94063.

Medical Secretary applications package for the Apple allows for the automation of appointment scheduling, private patient billing, insurance form preparation, medical history and patient record maintenance and word processing. The latest release 2.0 adds extended record lengths, improved editing, global diagnostic search, record reformatting, recent records review, and patient form letter preparation. The system also offers improved handling of specialist's medical reports, summary medical record preparation, and form preparation of referral letters. Operates in Apple II with ROM Applesoft and 48K or Apple III with at least 96K RAM. Requires 2 disk drives and a 132 column printer—\$695.95. Monument Computer Service, Village Data Center, P.O. Box 603, Joshua Tree, CA (800) 854-0561 ext. 802, in CA (800) 432-7257.

The **Real Estate Analyzer** offers true after-tax cash flows for any ten-year period, return-on-investment, internal rate-of-return, return-on-equity, boom/bust comparisons, current and future tax consequences, six different measures of profitability, report generation, and a tutorial on investment analysis. Ideal for scrutinizing property inflation, rent control, negative cash flow conditions, property tax limitation—\$150. Howard Software Services, 6713 Vista del Mar, La Jolla, CA 92037 (714) 454-5079.

Interactive courseware program in computer literacy is designed for junior and senior high school students. It involves the student with both the programming concepts and the social issues related to computers. Using a teacher directed approach, including group introduction to each chapter, **Computer Discovery** can be completed in approximately six weeks of normal presentation. The program can also be used on a student-directed basis allowing an individual to complete the course in as little as 15 hours, without the direct involvement of a teacher—\$195. Science Research Associates, 155 N. Wacker Drive, Chicago, IL 60606 (312) 984-2053.

Micro-DSS/FINANCE is a complete financial modeling and graphics software package for the microcomputer. Built-in functions include depreciation, net present value, internal rate of return and amortization. Flexible report writing lets the user custom design financial reports. Unique graphics feature permits retention for later replay as a "slide show" on the monitor. Over a year of field testing in a variety of business settings—\$1,500. Addison-Wesley Publishing Company, Business & Professional Division, Reading, MA 01867.

Life Insurance Client Management System stores 750 clients per diskette and runs in DOS 3.3 under Applesoft. Add, delete or change data in the file—print out selectively or produce mailing labels. Future enhancements to include interview comments, policy records, family information, balance sheet and more. One program diskette with 2 initialized diskettes for client records—\$85. Life Plan Analysts, P.O. Box 215, Springtown, PA 18081 (215) 326-8544.

The **Time Manager** is a daily organizer and personal information system which runs on a 48K Apple II computer. The user is able to create daily schedules, prioritize activities and record appointments, expenses and all pertinent personal data. Important information can be retrieved in seconds by scanning forward and backward in time. The built-in alarm alerts the user for key appointments or meetings. Daily, monthly and yearly totals are obtained quickly and easily. Provides generalized or itemized totals based on individual specifications, such as, a general travel account of itemized trip expense. Prints schedules, agendas, phone lists or any other important data. Includes both program and data disks complete with operating examples in a three-ring binder, instructions and a reference card—\$149.95. Image Computer Products, 615 Academy Drive, Northbrook, IL 60062 (312) 564-5060.

Paymaster Payroll System is totally menu driven and easy to use. Every element of data in every file is available to the user for modification—making cor-

rections quick and easy. Detail is kept for each check issued so you don't have to worry about timing the payroll runs with your quarterly reports. Prints the contents of the screen at any time! Supports variable pay periods. Tax tables are disk based so you can change the tables as the Government changes the rules. Multiple drives and system configuration are standard features—\$175. Masterworks Software, Inc., 1823 West Lomita Blvd., Lomita, CA 90710 (213) 539-7486.

A-STAT is a statistical analysis and file maintenance system for the Apple II. Computes frequencies, bi-variate tables—chi squares, correlation matrices, multiple regression, residuals. Includes a plot interface, File Cabinet interface, file sort, aggregation, report writing, reads VisiCalc files and has a complete transformation language. Uses standard DOS Text files and EXECs. Requires 48K and Applesoft in ROM—\$125. Rosen Grandon Associates, 296 Peter Green Road, Tolland, CT 06084 (203) 875-3541.

SoftCare is an advanced, software system designed to automate the billing and receivables functions in a medical office of one to seven physicians. The fill-in-the-blank screen formats are self-prompting and are edited for completeness and correctness. Unique "browsing" feature allows you to quickly and easily page through an electronic file of patient records. Produces a complete set of forms and reports including patient bills, insurance claims, claims exception report, patient and carrier aged accounts receivable, revenue by doctor, procedure frequency by doctor, patient transaction list and a daily transaction list. Procedure and diagnosis codes are user defined, with no limit on the number in the system. Runs on the Apple II with eight inch diskette drives or the Corvus hard disk—\$1,995. Demonstration diskettes with operator manual are available for \$60. Professional Business Software, 119 Fremont Street, San Francisco, CA 94105 (415) 546-1596.

Micro-Set is a computer phototype-setter service using microcomputer files. Words can be drafted on an Apple II word processor, then edited to add typesetting commands, such as font and size changes. Finally a special program sends the text to a typesetting machine. Text can be accepted either on disk or over the phone (at up to 1200 baud). Over 150 available type faces. Compu/systems 2724 First Avenue South, Seattle, WA 98134 (206) 622-3422.

Personal Software has introduced four new business software packages. They are **VisiPlot**, a high-resolution plotting

Start talking business

with your Apple

COBOL is the most effective business language. Apple II is the most friendly business computer. CIS COBOL with FORMS-2 brings together the best features of COBOL and Apple to enable you to deliver the most effective, user-friendly applications.

Business Programmers: Take the COBOL expertise you have acquired on big business mainframes, and use it on Apple II to create friendly applications that will talk directly to your users—where it suits them best, on their own desks.

CIS COBOL's dynamic module loading gives you big application capability and the FORMS-2 source generator lets you build and modify conversational programs from visual screen formats, creating much of the code automatically.

Application vendors: CIS COBOL with FORMS-2 steps up the pace for your development of the high quality professional application packages needed today. And creating them in COBOL makes them more maintainable.

Over half the Apple II's now being sold are going to business or professional users so demand for quality applications is growing fast, creating big business opportunities for you.

Stability proven by the US Government.

CIS COBOL has been tested and approved for two consecutive years by the US General Services Administration as conforming to the ANSI '74 COBOL Standard. Apple II under CP/M is included in CIS COBOL's 1981 GSA Certificate of Validation (at Low-Intermediate Federal Standard plus Indexed I-O and Level 2 Inter-Program Communication).

Get your hands on CIS COBOL at your Apple dealer.

Talk business with him now!

Micro Focus Inc., 1601 Civic Center Drive
Santa Clara, CA 95050. Phone: (408) 248-3982.

MICRO FOCUS

CIS COBOL with FORMS-2 for use on the Apple II with CP/M is an Apple Distributed Product. CIS COBOL and FORMS-2 are trademarks of Micro Focus. CP/M is a trademark of Digital Research. Apple II is a trademark of Apple Computer.

and graphics package that produces plots in six different formats and colors automatically using the latest version of VisiCalc—\$179.95. **VisiDex** is a highly flexible and personal information system which can store and retrieve information on a screen in a free-form unstructured way using keywords—\$199.95. **VisiTrand/VisiPlot** is a combination of VisiPlot graphics and a program for time-series manipulation trend forecasting and descriptive statistics—\$259.95. **VisiTerm** allows a personal computer to communicate with a variety of computers ranging from mainframes to micros. This program can send data files from the other programs between computers—\$149.95. Personal Software, 1330 Bordeaux Drive, Sunnyvale, CA 94086.

COMMUNICATIONS

The **Buffered Modem** is an advanced telecommunication operating system for the Apple II. Works with a wide variety of hardware including the D. C. Hayes Micromodem, the Apple Communications Card and any Serial Card made for the Apple today. Most 80-column boards are also supported using the configuration program provided. Includes a print buffer that prints only as fast as the printer can accept data. A capture buffer allows the user to capture in memory any or all of the modem sessions up to 23,000 bytes and save to or retrieve from disk if desired. Also supported is disk-to-disk transfer of any Apple DOS file with error check and re-transmission. This makes even a poor connection a secure link for transmitting important programs and files. Complete with full terminal program. At your local store or contact: Agent Computer Services, RR #3, Columbia City, IN 46725 (219) 625-3600.

GRAPHICS

Ultra Hi-Res Graphics for the IDS Paper Tiger 460G/560G is now available. This program is designed to take full advantage of the high resolution capabilities of either of the IDS printers. The program, which is transparent to Applesoft, first writes to disk then dumps from disk to printer without being restricted to the 280 x 192 resolution of the Apple's Hi-Res page—\$49.95. Computer Station, 11610 Page Service Drive, St. Louis, MO (314) 432-7019.

Software Driver allows the user to dump the contents of the high resolution pages to the new Epson MX-80 or Centronics 739 printers to obtain hard copy graphics. Enhanced version was designed for ease of use as well as flexibility

for the more advanced user. Supports eight (MX-80) or five (Centronics) types of interface cards. Fully menu driven with options for expanded graphics, position on the page, inverse or normal, page 1 or page 2, etc. Either version: \$44.95. Computer Station, 11610 Page Service Drive, St. Louis, MO 63141 (314) 432-7019.

A family of **3-D Programs** for your Apple includes the **A2-3D1** graphics package which is a utility designed to handle 3-D data bases and display them on the Hi-Resolution screen/s—\$59.95 on disk. The enhancement package **A2-3D2** adds color and independent movement of different objects at the same time \$24.95. The **A2-GE1** graphics editor allows you to create images as you view them. Scan them, animate them, combine them or add text or labels—\$34.95. **Saturn Navigator A2-3D/A** is an adventurous flight to Saturn, enter orbit and rendezvous with an orbital space station that awaits your arrival—\$24.95. The last three items require the A2-3D1 package. subLogic, Box V, Savoy, IL 61874 (217) 359-8482.

LANGUAGES

Pegasys Systems' new **P-LISP Interpreter** is a full implementation of the well-known Artificial Intelligence language. Written in machine code, this powerful interpreter includes the following features: 55 functions implemented, 45 page user manual, full function trace, fast, efficient garbage collector. Supplied with function editor and pretty-printer. Runs in 32 or 48K Apple II or II+ with disk. Eliza and other sample programs included—\$99.95. Specify DOS 3.2 or 3.3 Pegasys Systems, 4005 Chestnut Street, Philadelphia, PA 19104 (215) 387-1500.

APL for the Apple requires CP/M, Microsoft's Z-80 Soft Card and a 24 x 80 video card. A version is available which does not require a video card is the user can use mnemonics in lieu of the actual APL character set. Includes: 11 arithmetic functions, 11 Boolean and relational functions, 11 selection and structural functions, and 9 general functions including execute and format. Supports arrays up to eight dimensions. Includes 4 applications packages: Simulation of APL*PLUS file system, keyed Indexed Sequential Access Method (ISAM), Text Editor, and Check Management—\$500. Vanguard Systems Corp., 6901 Blanco, San Antonio, TX 78216.

SIMULATIONS/GAMES

Robotwar gives the players the opportunity to write a special battle language program which gives his or her robot its individual personality. This language controls such things as the robot's radar, laser cannon, speed and position. On the Robot Test bench, the player "de-bugs" this Battle Language program to ensure that the game strategy will be logically executed on the battlefield. Completed robots may be stored in an encrypted format on a friend's disk. This allows players to share robots without revealing their program secrets. Provides a bird's-eye view on the Hi-Resolution screen showing robots scurrying about, radar beams flashing, laser cannons aiming, flying shots exploding and expired robots disappearing in a poof. Like chess, it is an elegant strategy game. The basics of Battle Language are easily learned, yet RobotWar mastery may take a lifetime. Requires 48K, Applesoft ROM and a disk drive—\$39.95 includes membership in the RobotWar Club. Available at computer stores everywhere or from Muse Software, 330 N. Charles Street, Baltimore, MD 21201 (301) 659-7212.

Two new games from Sirius Software are **Sneakers** and **Gorgon**. Sneakers are little guys who appear to be friendly but will quickly stomp you out if you do not get them first. After sneakers come wave after wave of Cyclops, Saucers, Fangs, H-Wings, Meteors, Scrambles, and Scrubs. Written entirely in assembly language by Mark Turmell, Sneakers will operate on a 48K Apple II or II+ with disk drive and is playable with keyboard or paddle—\$29.95. Gorgon has you as a fighter pilot defending the planet by destroying strange creatures who are stealing people from the surface of the Earth. Do not run into these creatures or let their "smart eggs" hit you or you will explode. Features pause, restart, and sound control keys and some of the fastest color graphic routines ever programmed for the Apple. Has many different levels—\$39.95 requires 48K and a disk drive. From your local dealer only.

Phantoms Five by Nasir is a fast action full color hi-resolution fighter pilot game which places you in the cockpit dropping bombs on emplacements as you pass over them. At unexpected times, you soar into the sky in a dogfight with phantom fighters. Superb graphics and challenging action—\$29.95. **Pulsar II** is two programs in one—Pulsar has as its object the destruction of the spinning shields around the pulsar and the destruction of the pulsar itself. **Wormwall** is an ever-changing maze where walls do

not connect and openings occur temporarily. In the center circles spin madly with little creatures awaiting your arrival into their level of the maze—\$29.95. By Sirius Software, Inc., at your local dealer.

Crossword Puzzle System lets you create and play your own crosswords or work on the ones included. The Crossword Machine has easy or hard puzzles that are topical—\$24.95 disk plus \$2 postage and handling. L&S Computerware, P.O. Box 70728, Sunnyvale, CA 94086 (800) 227-1617 ext. 481 in CA (800) 772-3545 ext. 481.

Mate is a chess-problem-solving program that quickly determines whether or not mating is possible within the remaining number of moves, and it can solve mate, helpmate, and self-mate in n moves. Supports all four promotions, en passant, and castling. Uses FIDE standard notation and European board notation with user definable notation. Requires 48K with one disk drive—\$60. Mike Korhonen, Neitsytpolku 6 A 8, Sf-00140 Helsinki 14, Finland.

Mychess is the most advanced micro-computer chess program available for your Apple computer. Nine levels of play for beginners to grand masters. Winner of the Fifth West Coast Compu-

ter Faire. USCF rating of 1615. Requires Z-80 SoftCard—\$34.95. Through your local dealer or Datasoft, Inc., 19519 Business Center Drive, Northridge, CA 91324 (213) 701-5161.

Pool 1.5 for the Apple II is the first and only color graphics pool simulation. Provides real-time animation, 256 directions for aiming, 4 popular games: eight ball, straight pool, rotation, and nine ball. Instant replay for any shot and a special slow-motion control. Requires 48K Apple II with disk II and paddles—\$34.95. At your dealer or IDSI, P.O. Box 1658, Las Cruces, NM 88004 (505) 522-7373.

Tuesday Morning Quarterback is an exciting football simulation that gives you real control. You pick the NFL team that plays closest to your management style. Play with the computer or a friend. Call the plays like quarterback sneak, draw, sweep, etc., or pass plays, bomb, short curl, screen. Option and trick plays too. With a probability structure that comes close to the real thing—it's never the same game twice. Superb graphics in real-time with color and sound—\$29.95 at your local store or add \$2 postage and handling and order from: Automated

Simulations, Inc., P.O. Box 4247, 1988 Leghorn Street, Mountain View, CA 94040 (800) 824-7888 in CA (800) 852-7777.

UTILITIES

Convert Apple BASIC files to Pascal. **PUP I**, a user-friendly Pascal Utility Package was designed specifically for the Apple Pascal 1.1 environment. Features moving of BASIC files (Applesoft, Integer, Text, Binary) to a Pascal disk, sets system date at boot (automatically if you have a Mountain Hardware Clock), produces printer-formatted listings of Pascal text files, supports Pascal wild-cards, 40/80 column formats, upper and lower case, user modifiable BASIC tokens, error checking with diagnostic messages, single or multi-drive operation, on-line user assistance, full documentation—\$29.95. Dealer and club discounts available. Gryphon Micro-products, P.O. Box 6543, Silver Spring, MD 20906. Mr. Alan Weiner.

Disk Fixer and **Monitor Extender** are machine language programs which enable the experienced programmer to manipulate, protect and display data. Disk fixer provides easy access to either 13 or 16 sector formatted disks at either

SEX RATED

The most fun you can have
sitting down

For broadminded Apple II * owners. The wild, racy program for tongue-in-cheek (or wherever!) adult fun, stimulation and pleasure secrets.

X Rated, authored by Aphrodite and Don Juan, is the hottest disk in town. Every scene, every position, every sensual and hilarious action is animated in Hi-Resolution graphics. It'll be the life of the party. Your friends will be amazed, amused and shocked. Just watch their expressions when the action is matched with the 'sounds of sex'! X Rated is only for those not offended by explicit sexual matter. . .and who can chuckle at the human condition.

Mailed in an anonymous brown paper wrapper. If under 18 parental approval required. Inquiries invited from very-broadminded dealers.

Act now. **\$24.95** on diskette. Send to:

NO NAME SOFTWARE
8618 Reseda Blvd., Suite 115
Northridge, CA 91324
(213) 885-1955

\$1.00 shipping/handling charge.
(California residents add 6% tax)

the track or sector level. The user is allowed sector by sector access to named files. Displays information in hex, ASCII or a mixture of both \$29.95. Monitor Extender is a handy programming tool that enhances the capabilities of the Apple II Monitor ROMs. Memory may be displayed in ASCII or binary. A range of memory may be disassembled into an ASCII file in memory with the result a labelled file that can be used for assembler source code—\$19.95. Image Computer Products, 615 Academy Drive, Northbrook, IL 60062 (312) 564-5060.

Micro/Apple 1 is the first in a series of volumes containing 30 articles selected from MICRO magazine from 1977-1980. The staff has re-entered, listed, and tested the programs and put them on a diskette. Includes chapters on BASIC aids, graphics, education, games, I/O enhancements, runtime utilities and references—\$24.95 for book and diskette at your local store or add \$2 for surface shipment from MICRO, P.O. Box 6502, Chelmsford, MA 01824.

Memory Management System will put Dos into your memory expansion card giving you 10.5 K more program—usable RAM! Works with 3.2 or 3.3 and establishes all the hooks and links necessary to use DOS in its new location—

\$39.95. Micro-Sparc, Inc., P.O. Box 325, Lincoln, MA 01733 (617) 259-9710.

Dual DOS in ROM for the Apple II permits you to switch from one DOS (3.2 or 3.3) to another without booting. This utility is contained in two ROMs, which when plugged into MC's Romplus or the Andromeda ROMboard, will be permanently imbedded in your Apple's memory and waiting for instant access. Switching is practically instantaneous. A simple CALL from BASIC or direct from the Monitor is all that is required. Recommended for drives configured with 3.3 ROMs. Operates with either BASIC or the Language Card and requires 48K, DOS 3.3 and the above mentioned expansion boards—\$49.95. Soft CTRL Systems, Box 599, West Milford, NJ 07480.

Copy II Plus is the ultimate Apple disk copy program. Copies multiple formats: DOS 3.2, 3.3, PASCAL, FORTRAN, and CP/M. Copies diskettes in less than 45 seconds, which is faster than most other copy programs. Written entirely in ultra fast assembly language. Requires Apple II with 48K and at least one Disk Drive—\$39.95. Central Point Software, Inc., P.O. Box 3563, Central Point, OR 97502 (503) 773-1970.

Apple Alarm is a program that converts your computer into a sentry, keeping track of intrusion, smoke, motion, fire, moisture and other on/off sensory inputs. Attach your switch, fire alarm, floor mat, etc. to the paddle buttons and your Apple will sound an alarm or quietly keep time from the moment triggered—\$20. Andent, Inc., 1000 North Avenue, Waukegan, IL 60085.

WORD PROCESSING

WordStar does it better than any other word processing system. Not only do you get all the sophisticated features you'd expect from the high-priced WP system, with Word Star you have a true screen image of what your printout will look like before you print it. Erase, insert, delete and move entire blocks of copy. Page breaks are displayed and automatically revised on the screen. You can specify enhancements like underlining and boldfacing, and much more. Easy to learn because of its unique and extensive self-help menus. Sold through authorized dealers and distributors only. OEM inquiries invited. Requires Micro-Soft Softcard and 80 column video board. Write for address of nearest

Verbatim Comments:

“Compared to the brands I’ve used before, Verbatim Datalife™ is the best yet!”

*Sandy Tiedeman
Las Vegas, NV*

“New Verbatim helped eliminate I/O errors on my Apple.”

*Richard Adams
Ft. Walton Beach, FL*

“I would prefer Verbatim Datalife over any brand I’ve ever used.”

*Skip Piltz
Overland Park, KS*

“My experience with Verbatim diskettes has been excellent. I’ve used several boxes over the past few months and they’ve all been error-free.”

*Robert Roeder
Las Vegas, NV*

“Much stronger, better centering. A definite improvement.”

*Leroy LaBalle
Marrero, LA*

“It has worked perfectly everytime!”

*Richard Ruth
Shippensburg, PA*

“I like the thicker protective cover.”

*David Hendel
Lititz, PA*

“Great! I have had no problems!”

*Timothy Roscoe
Mechanicsburg, PA*

“So far my Verbatim disks have been performing flawlessly. Not always so with other disks.”

*Chris Otis
Hoffman Estates, IL*

“Runs quieter in the disk drive.”

*Richard Cannova
Los Angeles, CA*

“Verbatim disks are super. They’re our standard for quality.”

*Bob Mills
Mission, KS*

“Anything that prolongs the life of a diskette is a plus. Thank you Verbatim for an excellent improvement.”

*Steve Toth
Piscataway, NJ*

“Of the 130-plus Verbatim disks I have, I’m not aware of any problems. I’m sure the improvements will give your disks an even longer life.”

*Gerald Janas
Warren, MI*

“FANTASTIC. Not a single registration problem. Much more reliable than what I had been using.”

*Gary Sandler
Playa Del Rey, CA*

“Verbatim is much more reliable. I wouldn’t trust anything else.”

*Howard Chin
Pomona, CA*

“Thank you for the improvements. Just another reason why I’ll always use Verbatim.”

*James Hassler
Cheyenne, WY*

We introduced Verbatim Datalife mere months ago. And it’s already playing to rave reviews like these.

But don’t take anybody else’s word for it. Try it yourself, and see if you don’t agree it’s the best media you’ve ever tried. For the name of your nearest Verbatim dealer, call (800) 538-1793, in California call (408) 737-7771 collect.

dealer to: Micro Pro International Corporation, 1299 4th Street, San Rafael, CA 94901 (415) 457-8990.

Letter Perfect is a character oriented word processor for the Apple II/II+. Fast action machine language, menu driven, single load program. Requires disk drive and 32K memory. One-time configuration for your system, printer type, etc., can be reconfigured at any time. Supports proportional spacing, underline, boldface with NEC or Qume/Diablo. Will use any of the special print characters of your specific printer. All text packed during saving for greater disk storage capacity. Uses Super'R Term 80 column board—\$149.95. LJK Enterprises Inc., P.O. Box 10827, St. Louis, MO 63129 (314) 846-6124.

Hebrew II is the first foreign language word processor for the Apple II in America. This program puts Hebrew characters on the screen from right to left (and numbers left to right in their natural order) and allows full cursor movement and character editing. Text can be printed, saved to disk, and recalled for further editing. Ideal for labeling graphs, charts, etc.—\$60. Aurora Systems, Inc., 2040 E. Washington Avenue, Madison, WI 53704.

Catalogs

Three "where to find it" books are now available. They are: **Business Software** \$5.95, **Games and Recreational Software** \$4.95, and **Educational Software** for the teacher/student \$5.95. WIDL Video, 5245 W. Diversey Avenue, Chicago, IL 60639 (312) 622-9606.

CATALOGS/BOOKS

32 BASIC Programs for the Apple Computer is exactly what the title says, a group of practical applications programs for home and work, for education, graphics, and mathematics. Also includes games. By studying the programs, you can also pick up some pointers on efficient programming. Written by Tom Rugg and Phil Feldman. 285 pages, 5½ × 8¼ inches, perfect bound, softcover. \$17.95. dilithium Press, P.O. Box 606, Beaverton, OR 97075 (503) 646-2713.

An atlas to the Apple Computer, **What's Where in the Apple** is written by William F. Luebbert. This definitive programmer's guide to the Apple II describes all the hardware and firmware characteristics important to programmers, including over 2,000 memory locations.

The book expands upon the author's highly popular article published in MICRO, August 1979. Approximately 192 pages 8½ × 11 inches, cardstock cover and wire-O binding. Publication in August 1981—\$19.95. MICRO, 34 Chelmsford Street, P.O. Box 6502, Chelmsford, MA 01824 (800) 227-1617 ext. 564 in CA (800) 772-3545 ext. 564.

Here is a complete **product catalog** of computer supplies, accessories and cables; includes furniture, printer forms, media, modems, printers, media carriers, etc. **Inmac**, 2465 Augustine Drive, Santa Clara, CA 95051 (408) 737-7777 or (201) 767-3601.

The Fall 1981 **Brain Food Catalog** is now available, with a \$1 off money-saving slip inside to be used on all orders of \$10 or more. Over 80 titles are featured with the scope of difficulty ranging from complete novice to confirmed computer user. Highlighted are such books as **Computers for Everybody**, **Small Computers for the Small Businessman** and **How to get Started with CP/M**. Call the toll free number 800-547-1842 or write dilithium Press, 11000 SW 11th Street, Suite E, Beaverton, Oregon, 97005.

This **general catalog** of computer supplies and accessory products contains binders, media, word processing items, ribbons, work stations and supplies, calculators, templates, etc. **Visible Computer Supply Corporation**, 3626 Stern Drive, St. Charles, IL 60174 (800) 323-0628 in IL (312) 377-0990.

A new **catalog** from **Mini Micro Mart, Inc.**, has printers, media and supplies for micros and minis includes Cromemco systems, plotters, software, etc. 1618 James Street, Syracuse, NY 13203 (315) 422-4467.

1981 Tool Kit Catalog offers specialized test equipment and tools, cases, oscilloscopes, digital multimeters, probes, wire wrap tools, etc. **Specialized Products Company**, 2324 Shorecrest Drive, Dallas, TX 75235 (800) 527-5019 in TX (800) 442-3034.

Dataguide is the master catalog and directory of OEM computer products. Some items for sale are computers and processors, memories, disk and tape drives, crt displays, printers, plotters, punched card/tape, peripheral controllers, data communications devices, data acquisition analog I/O systems, test/development systems, software and media and supplies—\$25. **Sentry Publishing Company**, 5 Kane Industrial Drive, Hudson, MA 01749 (617) 562-9308. Published semi-annually, subscriptions \$50/year or \$75 oversea.

Personalized Computer Consultants provides a **catalog** of many computer-related items including computers, peripherals and software. 11426 Rockville Pike, Suite 110, Rockville, MD 20852 (301) 770-5311.

Monument Computer Service has announced the release of its new free Summer-Fall **Software Catalog**. The new catalog features, for the first time, products specifically prepared to operate on the Apple III computer. It also features many new or improved educational products for the Apple II and Apple II Plus computers. Free. Monument Computer Service, Village Data Center, P.O. Box 603, Joshua Tree, CA 92252 (800) 854-0561 ext. 802 in CA (800) 432-7257.

Queue, Inc., has issued new updated **directories** of educational software. Catalogue IVA contains the most complete, comprehensive lists available anywhere of education software and educational software publishers for Apple, Atari, and CompuColor. Catalogue IVB contains 97 pages of educational software program descriptions for Pet and TRS-80. The most complete selection available, hundreds of programs grouped by computer, subject matter, and grade level—\$8.95 each from Monica Kantowitz, President, Queue, Inc., 5 Chapel Hill Drive, Fairfield, CT 06432 (203) 372-6761.

Miscellaneous

Mini-Flex Diskette Holder has a clear plastic smoke-colored cover to seal out dust. Bottom is stepped and dividers keep disks from falling over. For 5¼ inch diskettes. Advance Access, 2200 South Main Street, Lombard, IL 60148 (312) 629-5800 or (800) 323-3412.

Tee-shirts are available to user groups or individual group members from Automated Simulations, Inc., maker of the EPYX line of computer games including the popular "Temple of Apshai". Light blue tee shirt bears a bright red dragon and dark blue logo and slogan: "EPYX, Computer Games Thinkers Play." Normally priced at \$6, the shirts are available to group members at \$5 in mens' sizes small, medium, large and extra large from Automated Simulations, Inc., P.O. Box 4247, Mountain View, CA 94040 (415) 964-8021.

Catalog of gifts for Apple fanatics includes such attractive and useful items as coffee mugs, tumblers, tee-shirts, playing cards, jewelry, paper weights and pens. **Apple Computer Gift Catalog**, 2280 Arbor Blvd., Dayton, OH 45439.

Buffer Overflow

CONVERSATION WITH A CUSTOMS OFFICER

by Brian Strong
from The Electric Apple

(Note: Mr. Strong, Publisher of **The Electric Apple**, lives in Wellington, New Zealand. We offer here his description of a situation which highlights the relative newness of Apples, the government process, and the truly international nature of the IAC. —PCW)

Have you ever had to clear a computer program through Customs? It can be quite an experience.

Part of the problem is that personally owned microcomputers are a new fact of life in New Zealand, but every package of software seems to be regarded as something "for commercial use" and liable to extortionate duties. I received a program for personal use and spent some time explaining the whole concept of personal computing to the Customs Officer, who seemed unaware of its existence. I also halted traffic around the Post Office counter by letting loose with a strangled scream, just in time to stop him from scratching the surface of the disk with his fingernail to see what it was made of.

My conversation went along these lines:

"Yes, it is a magnetic recording."

"No, it's not the same rate of duty as magnetic tape or cassette (music) recordings."

"It's a recording of information data and only works on my computer."

"No, I'm not going to sell it to anyone."

"It's binary encoded data, sort of electronic writing that the computer understands."

"Try another page in your book, perhaps it's there somewhere. Try 'computer program'."

"No, it's for personal use."

"Yes, it's a commercially available program overseas, but not in New Zealand."

"No, I can't make copies and sell them"

"Try another page; perhaps it's under electronic goods or something."

"No, the 40 percent import duty is just for hardware, not software."

"Hardware? That's the bits of wire and stuff all thrown together to make a piece of equipment."

"No, it's not equipment. The disk doesn't count as equipment. Try 'computer programs' again."

"That rate of duty is for programs for mainframe computers."

"Sorry, they're those big installations that fill up half a building—y'know, like IBM. It can't be the same rate."

"No, my computer fits under one arm and you can carry it around."

"When's the other guy get back from lunch?"

Look, the usual duty is just on the medium—that's the value of the disk, and they're about three to five bucks each in the States."

"You feel you should charge me on the value of the program too—hey, that's a bit steep. Let's have a last look in that book again."

"Hey, look on that Customs sticker—it says total value twenty dollars."

"How do I know what it costs? A mate in the States sent it to me to have a look at."

"Come to think of it, it was probably about what it says. Things like this are cheap in the States."

"Look, what about working the duty out on the cost of the disk, say four dollars, and half the balance? It's about the nearest we'll probably get."

"Yeah, it is a fairly new hobby; that's probably why it isn't in the book."

"Yeah, it is all rather confusing and needs straightening out."

"See you again sometime."

"Bye."

I've been through that situation twice, with roughly the same conversation each time. Not to go through it could mean a massive 40 percent duty on a program purely for personal use and of no interest to anyone else. There is still a lot of confusion between this type of computer program and "commercial" programs that hasn't been sorted out. Hopefully, it will be soon, otherwise next time I get a card in my postbox saying that there is a computer program waiting to be cleared through Customs, I'll be ready to be fitted with a long-sleeved canvas overcoat.

The pfs: software series

A Personal Information Management System.

Your APPLE* computer really can track purchase orders and inventory, analyze your investment records, maintain client and patient histories, or even catalog magazine abstracts and your stereo collection. Software Publishing Corporation has the answer and it doesn't require programming!

We call it the PFS software series—an easy to use yet powerful set of programs that let you design a system that's versatile enough to manage almost any kind of information.

PFS, the personal filing system, let's you design your own form on the screen for organizing information. Once it's created you just fill in the blanks. Looking up what you've filed is just as easy. PFS can search for a number, a single piece of data, a word within a page of text, or any combination. All forms that match are displayed on the screen for browsing, updating, expanding, or printing. PFS can even create mailing labels.

PFS: REPORT, the personal report system, uses the files PFS creates to produce a report tailored to your

PFS is a trademark of Software Publishing Corporation.

specifications. Just mark the information you want listed and PFS: REPORT will sort it and let you specify headings, totals, averages, counts, and calculations. You can save your report design for use on a regular basis.

PFS and PFS: REPORT come with simple self teaching manuals plus a support plan that includes program updates and factory experts ready to answer your questions. And all of this at an affordable price. Each program is priced below \$100.

The PFS software series is different. It is not a specialized application package nor a complex programmer oriented data base manager. It's a personal information management system that lets you store, retrieve, and report information your way without programming. The PFS software series is available

through your local dealers. If they don't carry it have them give us a call at (415) 962-8911 or write to us at Software Publishing Corporation, 2021 Landings Drive, MtnView, CA 94043.

Mountain Computer CPS MultiFunction Card™

The Only Interface Card You Need!

Connecting a Parallel Printer?

Epson® · Centronics® · IDS Paper Tiger® · CPS handles all these printers and others with on-board intelligence to provide paging and other features found on no other card.

Connecting a Serial Printer?

Diablo® · Qume® · NEC · TI 800 Series® · CPS handles these printers and others with standard RS-232 interface providing selection of baud rates, handshakes, paging, and more.

Connecting a Modem or Terminal?

Hayes Smartmodem® · Novation CAT® · M & R Pennywhistle® · CPS handles these and others with full/half duplex operation, baud rate selection, and even a transparent terminal mode which includes a dual mode feature that permits printing of text to parallel printers while 'on-line' eliminating the need for special terminal software—and more.

Connecting with the Time?

The on-board calendar/clock provides real time and date information including day of week, day, month, year, hours, minutes, and seconds for any application requiring a time stamp—battery backed-up for over two years!

Connecting with The Source?

Used with a modem, CPS provides the connection to information utilities, such as The Source® · Dow Jones, and others. Additionally, CPS provides the connection to big-time electronic mail with programs such as Micro Courier® and Micro Telegram®, and other data transfer programs.

Connect with Easy Use!

CPS has no switches to set! All functions on the card are set from a user program. Menu driven screens set up your choice of all functions on CPS and store them on-board in CMOS RAM—battery backed-up (including the clock) for over two years! To change parameters, run the set-up program again—or use special commands from your keyboard. Furthermore, most existing software programs are immediately usable with CPS. *Phantom Slot Capability* permits assignment of CPS' functions to your software's pre-defined slots.

Connect with Your Apple® Dealer

Drop by your Apple dealer and see how the CPS MultiFunction Card provides the most comprehensive capabilities for RS-232C serial interface, parallel output, and real-time calendar/clock of any card available today—all on one card—at one low price—competitive with *any one* of the three or more single function cards that it replaces.
