Introducing the Most Powerful Business Software Ever!

TRS-80™ (Model I, II, III, or 16) • APPLE™ • IBM™ • OSBORNE™ • CP/M™ • XEROX™

The VERSABUSINESS™ Series

Each **VERSABUSINESS** module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™ $99.95

VERSARECEIVABLES™ is a complete menu-driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALEDGER II™ and VERSAINVENTORY™.

VERSAPAYABLES™ $99.95

VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record on each vendor, prints checks, check registers, vouchers, transaction reports, aged payables reports, vendor reports, and more. With VERSAPAYABLES™, you can even let your computer automatically select which vouchers are to be paid.

VERSAPAYROLL™ $99.95

VERSAPAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government-required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on screen for operator approval. A payroll can be run totally, automatically, or the operator can intervene to prevent a check from being printed, or to alter information on it. If desired, totals may be posted to the VERSALEDGER II™ system.

VERSAINVENTORY™ $99.95

VERSAINVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSAINVENTORY™ keeps track of all information related to what items are in stock, out of stock, on backorder, etc., stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly or to link with the VERSARECEIVABLES™ system. VERSAINVENTORY™ prints all needed inventory listings, reports of items below reorder point, inventory value reports, period and year-to-date sales reports, price lists, inventory checklists, etc.

VERSALEDGER II™ $149.95

VERSALEDGER II™ is a complete accounting system that grows as your business grows. VERSALEDGER II™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system **without any additional software.**

- VERSALEDGER II™ gives you almost unlimited storage capacity (300 to 10,000 entries per month, depending on the system),
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALEDGER II™ comes with a professionally-written 160 page manual designed for first-time users. The VERSALEDGER II™ manual will help you become quickly familiar with VERSALEDGER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

SATISFACTION GUARANTEED!

Every **VERSABUSINESS™** module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any **VERSABUSINESS™** module, you may return it within 30 days for a refund. Manuals for any **VERSABUSINESS™** module may be purchased for $25 each, credited toward a later purchase of that module.

SUPERMICRO PERFORMANCE

PDQ is a powerful 32-bit coprocessor and multifunction system which substantially increases the processing speed and capabilities of Apple II and //e series computers.

PDQ technology preserves your current investment in software and training while providing an almost unlimited growth path.

ADVANCED OPERATING SYSTEMS

With the PDQ system, an Apple is capable of performing multitasking under a variety of advanced operating systems including CP/M 68K, the p. System and UNIX derivatives. Program development in advanced languages such as C and LISP is more efficient with PDQ's enhanced environment.

HIGH SPEED APPLESOFT

Execution speed of a standard Applesoft program can be as much as 40 times faster with the PDQ system. Most commercial software written in Applesoft Basic, such as the BPI General Accounting System, will exhibit significantly better performance.

To order your PDQ send your check or money order directly to:

Don't buy a spreadsheet

A lot of electronic spreadsheets can't cover your needs. They just don't go far enough.

They can't adapt to the way you think. They speak in hieroglyphics (/GF$, /R, /S#S), instead of English.

Time for Microsoft® Multiplan,® the high energy spread. Software that's rich with understanding. Full of high performance capabilities for Apple® II, III or Macintosh.™

Multiplan loves you as you are.

Other spreadsheets force you to learn how they think. Multiplan learns how you think. It remembers the way you work. Anticipates frequent commands. Even offers suggestions on spreadsheet set-up.

Multiplan not only uses English commands, it allows you to create formulas in English. Instead of typing mysterious coordinates like H54–L73=BK154, you can simply name worksheet areas: Sales–Costs=Profit.

Multiplan can link data in different spreadsheets. Make a change on one, and every related one is changed.

that spreads too thin.

And if you have been working with VisiCalc,® Multiplan can read its data files and teach it new tricks. Like how to set up variable column widths and sort data.

The wish list.

Only Multiplan has optional Multiplan Application Programs that work with you to design and build custom spreadsheets for Budget Analysis or Financial Statement Analysis in minutes. Not hours. Not days.

MICROSOFT®

Small wonder Microsoft gets more performance out of a spreadsheet. We designed the MS-™DOS operating system that tells the IBM® PC how to think. And our BASIC is the language spoken by nine out of ten microcomputers worldwide.

A main attraction of the mammoth 1984 Fall COMDEX show, Apple Computer, Inc. proved that the personal-computer war is anything but over.

APPLE IS STRONG AND CONFIDENT

Every year a few major computer shows signal the state of the microcomputer industry. Last November's Fall COMDEX in Las Vegas was no exception, and Apple Computer, Inc., made a strong showing.

COMDEX has become the most important trade event of the personal-computer industry, witness the 22 miles of aisles; the thousands of booths; and the throngs of dealers, exhibitors, and reporters at last fall's show.

Some industry pundits complained of a lack of innovation, commenting that exhibitors were merely turning out bigger and better versions of existing products.

I cannot concur with that reproach, however. Industry observers, who have seen years of impressive innovation and hypergrowth, may have unrealistically high expectations. Also, Apple was not a target of these criticisms and proved to be one of the main attractions at the show. There were actually plenty of new and interesting products at COMDEX, especially in the Apple arena.

Compared to the 1983 COMDEX shows, at which Apple was viewed as a seriously wounded soldier in the war with IBM, 1984's Fall COMDEX was a dramatic contrast. With many of its wounds healed, Apple was strong and confident. In 1983, many observers thought that IBM had won the war of personal-computer standards, but, with the introduction and subsequent development of the Macintosh, Apple has stubbornly clung to its desire to set a new standard.

Although I have to admit that I was concerned in 1983, last fall's trek to Las Vegas convinced me that Apple was holding its own, providing innovations that the rest of the industry could not ignore. My conviction sprang from the moves of various companies to imitate the Macintosh's distinctive software interface, which makes computers easier to use. Most notable was Digital Research's new software product called GEM, for the IBM Personal Computer and other compatible computers. GEM makes the PC work nearly identically to the Macintosh, with pull-down menus and icons. Well, you know what they say—imitation is the sincerest form of flattery.

Apple's regained strength in the marketplace was also reflected by the plethora of companies designing software and hardware products to work with Apple computers, especially the Macintosh. No one need be concerned anymore about a lack of software for the Mac. If you doubt that assertion, take a look every month at "Pipeline," our coverage of the latest software and hardware of interest to Apple owners. It starts on page 134 in this issue.

So, as you can tell, I am feeling quite buoyant about the Apple market. I don't mean to imply that there isn't room for growth, but I am happy to report that after a long, hard couple of years, Apple is back on track and running strong.

For the scoop on the hottest products at COMDEX, as well as other tidbits on the industry, please turn to Fred Davis' column, "News+," which appears, starting this month, in a new location toward the front of the magazine. +

The word is out on word processors. Format-II® ranked number one.

We've always thought of Format-II as the finest, easiest to use word processor for Apple® II+, IIe and Apple IIc computers. We're pleased that Peelings II magazine agrees. They judged Format-II best out of 18 leading word processors. Here's why:

Format-II makes editing easy.
There's our unique editing process: simple, mnemonic commands logically relate to the task you want to perform. To center text, you press [C]. To delete, [D]. To justify, [J].

And since what you see on the monitor is exactly what will print out, editing and formatting is always a breeze.

The Peelings II reviewer said, *"Format-II is one of the few word processors that is so comfortable and predictable, I would consider it as an addition to my small library of personal software."*

Reviewed by John Martellaro, September 1983, based on Peelings II rating system for performance and performance to price ratio.

Format-II supports all printers.
Unlike other word processors, Format-II is compatible with *every* printer that works with the Apple, from the simplest dot matrix printer to the most advanced letter quality printer.

A built in mailing list at no extra cost!
Actually a database system resembling an index card file. A SORTING program will arrange the mailing list alphabetically or numerically. Powerful LOGIC commands merge specific entries into form letters and documents.

In the words of the Peelings II reviewer: *"This is the best program I have seen for people who do a lot of work with mailing lists, form letters and short correspondence."*

An easy to follow manual.
Essential to any good program is a manual that's clear and understandable. The Peelings II reviewer describes the Format II manual. *"All in all, it is one of the best word processor manuals I have seen. The latest documentation is a model of clarity and organization."*

Put it all together. Then add features such as support of hard disk drives and a standard DOS text file format compatible with spellers and communications programs, and it's not hard to see why Format-II has earned the number one rating.

The words of the Peelings II reviewer sum it up: *"I cannot think of another word processor that would be better overall for business use."*

Thanks Peelings II. We couldn't have said it better ourselves.

LETTERS TO THE EDITOR

PRODOS TIME AND DATE

Dear *A+*,

If you've used the new ProDOS-based upgrade of Apple Writer, you know that the software makes no provision for implanting the time and date onto files other than by means of a Thunderclock.

Here's a tip on how users of the new ProDOS Apple Writer can implant the date and time onto their Apple Writer files and formatted disks without using a Thunderclock. Basically, the procedure involves substituting the ProDOS on the ProDOS users' disk for the ProDOS on the Apple Writer disk:

1. Complete the date-and-time setting program on the ProDOS users' disk.
2. Go to ProDOS BASIC.
3. Remove the ProDOS users' disk from drive 1 and insert the ProDOS Apple Writer disk.
4. Change the prefix to the following: /AW2MASTER.
5. Use the new dash command to run the AW.SYSTEM file in this way: -/AW.SYSTEM.

After completing these steps, you will have booted up ProDOS Apple Writer with your date and time in memory, ready to be stamped on your Apple Writer files as you create and modify them or on the disks that you format using Apple Writer.

Applesoft BASIC programmers can create a ProDOS Apple Writer preboot by copying the time/date program on the ProDOS users' disk onto a ProDOS start-up disk (a ProDOS disk containing both ProDOS and BASIC.System from the ProDOS users' disk that can boot or start up by itself). By naming the time/date program STARTUP, you'll be able to run the program when the disk is booted. Add the two ProDOS commands listed above to this program, with an appropriate menu, and you've created a handy preboot for ProDOS Apple Writer.

PRODOS SECRETS

Dear *A+*,

I've been a TRS-80 user from Day 1. Last June I bought an Apple IIe. My disappointment with ProDOS/Applesoft has been almost boundless. How blessed Tandy users are to have a multitude of DOSs and Enhanced BASIC to choose from.

Imagine my shock when I came upon Charles Doherty's article "ProDOS Revisited" (*A+* November 1984, page 61). I was just thinking about buying a RAM/Disk Utility Program yesterday. And who has ever heard of STORE, RESTORE, FLUSH, etc.? Which sent me scrambling back to the little *ProDOS User's Manual* that came with it. Nothing! Only silly instructions on how to use some simple, menu-driven programs. Not a hint of the available commands. Not even a little hint that for $25 to $150 you can buy more books to find out what is there. Not even a little hint that some of the old DOS 3.3 commands may no longer work in your ProDOS program. Nothing!

I hope you'll consider doing something more in depth. Surely there must be others just as ignorant as I am.

Jerry Rutledge
Waseca, MN

OMNIS INFO

Dear *A+*,

I followed with interest your tutorial on dBASE II. Many more sophisticated database programs are on the market now, and some of us would appreciate some tutoring on software that is more state of the art. In your September issue you reviewed one such program, Omnis 2. I am a new user of Omnis 3 on an Apple IIe—an extremely powerful and flexible database system. Since it is a British product, I have been unable to find much in the way of local support, although Organizational Software Corporation has told me it is developing additional documentation. Are any *A+* readers aware of any users' groups or additional documentation on the product?

The Print Shop

In our review of The Print Shop on pages 95 and 96 of the December 1984 issue of *A+*, we stated "The Print Shop includes bright-colored tractor feed paper . . . , matching envelopes, and colored ribbons." Actually, the colored ribbons do not come with the package, but you can order them separately from Brøderbund, using an order form that comes with each package.

Fire in the Valley

In our two excerpts of *Fire in the Valley* (December 1984 and January 1985), we neglected to list the book's publisher. *Fire in the Valley* is published by Osborne/McGraw-Hill, of Berkeley, California.

Seeing Double

The two insets in the illustration of "Seeing Double, Part 1," (*A+*, December 1984, page 99) are courtesy of Doublestuff Software, Inc., Brooklyn, New York.

SAT Improvement

Our coverage of the College Board SAT program from Krell Software ("Scoring on the S.A.T.," November 1984, page 72) included the following sentence: "If students use the program for at least six hours and do improve total SAT results at least 70 points over the previous score, buyers can get their money back by presenting the results of both tests." The sentence should have read, "If students use the program for at least six hours and *don't* improve total SAT results . . . buyers can get their money back by presenting the results of both tests." Also, Krell has informed us that it has amended the money-back guarantee for the latest version of the program to apply only to students who don't improve their SAT results more than *80* points over their previous score.

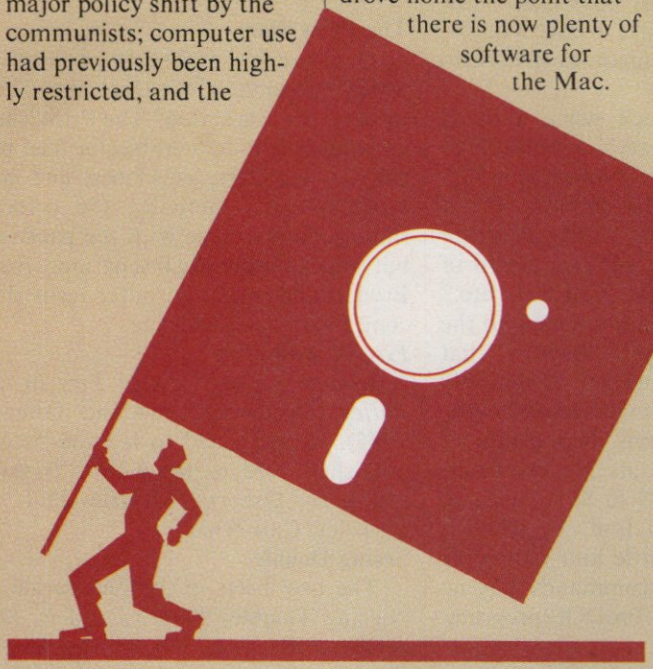
RED APPLE

The USSR has announced another of its famous five-year plans. This time the focus is on teaching personal-computer use in schools. This decision represents a major policy shift by the communists; computer use had previously been highly restricted, and the Russian populace did not have access to personal computers.

To kick off their five-year push into personal computing, they have introduced the Agat, the first Soviet-made microcomputer. Believe it or not, the Agat is compatible with the Apple II. The color of the case is, appropriately, red.



APPLE SHINES AT COMDEX

Apple Computer, Inc., stole the show at the 1984 Fall COMDEX Show in Las Vegas. President John Sculley delivered the show's keynote speech, and the large, two-story Apple booth was the most crowded at the five-day show. The booth was bursting with new third-party products for the Macintosh, which contributed to the popularity of Apple's exhibit and drove home the point that there is now plenty of software for the Mac.

ALL THAT JAZZ

Lotus Development Corporation is putting the final touches on its long-awaited product Jazz, an integrated-software package for the Macintosh. The program, which will be available in March, looks excellent, but I must confess to some skepticism about the name. Since Lotus' 1-2-3 is widely considered a standard in business software, the introduction of Jazz enhances the Macintosh's credibility as a business computer. Because the program outperforms 1-2-3 and Symphony, IBM PC owners may soon be looking at the Macintosh with a bit of envy.

APPLEWORKS VS. LOTUS 1-2-3

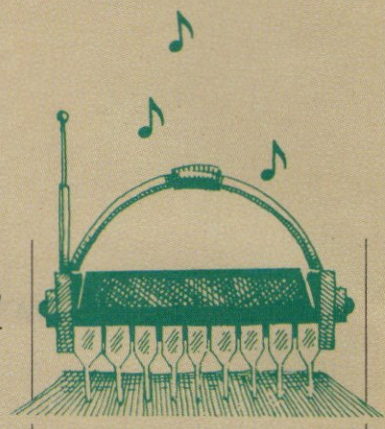
The AppleWorks integrated-software program for the Apple II series is the most successful software program since Lotus 1-2-3. During 1984, AppleWorks became a runaway best-seller, with sales climbing to 20,000 units a month. This figure garnered AppleWorks an enviable 12% share of all the software sold in the U.S., placing it second only to Lotus 1-2-3, which captured a 15% share. No other software packages came close.

PIRATE PROBLEMS

Some software pirates are tainting the reputation of Macintosh users' groups by distributing purloined programs. For instance, pilfered copies of Brøderbund's Lode Runner for the Mac were distributed at the Stanford, California, Mac Users' Group before the program was even released. Organizers of users' groups should be more alert to this problem and apply peer pressure to stop program poaching. Users' group meetings are for the exchange of information, not for the exchange of copyrighted programs.

CHIP CHAT

Philips, the Dutch electronics giant, introduced a music-synthesizer chip—as yet unnamed—at last year's Electronics Components show in Munich. The chip can generate stereo sound,



complex music, and sophisticated sound effects. The 16-pin chip has six tone generators, two noise generators, and six noise-frequency mixers. The good news for Apple users is that the new music chip is compatible with both the 6502 and the 68000 families of microprocessors.

MACINTOSH OFFICE

Apple is reportedly planning to make a big push into office automation this year, an area previously dominated by IBM, Xerox, Wang, and Lanier. The cornerstone of the Apple office-automation plan is the concept of interconnecting a group of Macintoshes with the low-cost AppleTalk network. The network will let the Macintoshes share common peripherals such as a mass-storage device and the sophisticated new Apple laser printer.

WOZ WINS ONE, LOSES ONE

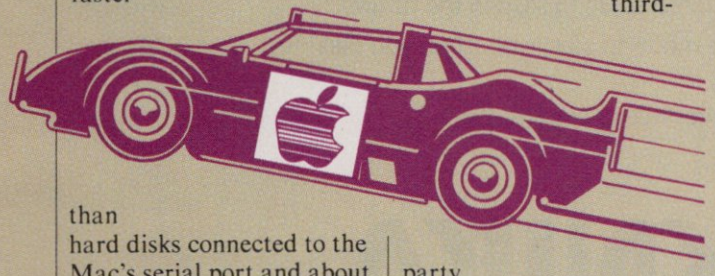
Gambling is a way of life in Las Vegas, and we found Steve Wozniak "doing in Rome as the Romans do" during Fall COMDEX. Woz claims to have a new system for winning at blackjack, which seemed to be working, judging by the number of $100 chips he had stacked up. Woz was

also immersed in controversy because of an *InfoWorld* article in which he was quoted as saying that Apple was planning a 16-bit version of the popular IIe computer, called the IIx. Apple vigorously denied the rumor and pressured Woz into writing a letter to *InfoWorld* retracting his statements about the IIx.

HOTTEST NEW PRODUCT AT COMDEX

Last month, "News+" reported that Apple was rumored to be planning a new version of the Macintosh, code-named the TurboMac, featuring a built-in hard disk. A third-party developer has beaten Apple to the punch by introducing the HyperDrive, which should be available by the time you read this issue.

The HyperDrive is a 10-megabyte, 3½-inch hard-disk drive that mounts inside the Macintosh. It has a 5-megabit-per-second transfer rate and an average disk-access time of 85 milliseconds, which makes it a whopping seven times faster than hard disks connected to the Mac's serial port and about 20 times faster than the Mac's 3½-inch floppy drive. To top it off, an auto-start ROM chip allows the Mac to start up directly from the hard disk. With installation, HyperDrive purchasers will get a memory upgrade to 512K RAM for less than retailer charges.

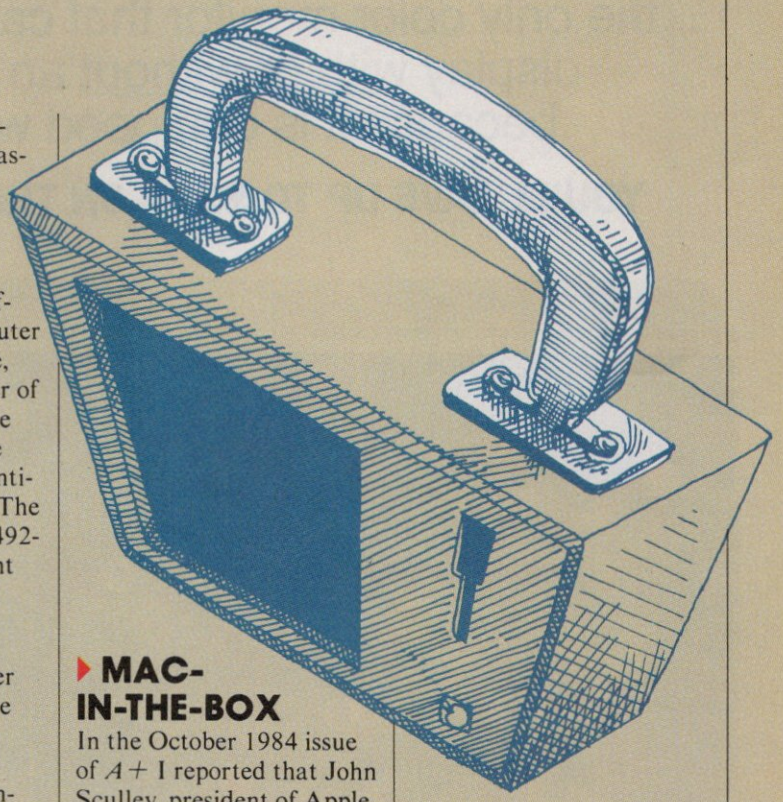


The HyperDrive is offered by General Computer Company of Cambridge, Massachusetts, producer of the Ms. Pac-Man arcade game and popular home video games such as Centipede and Pole Position. The phone number is (617) 492-6351. Tell them *A+* sent you.

JACKINTOSH

Jack Tramiel, the former president of Commodore who is now president of Atari, has announced Atari's plan for a Macintosh-like computer. It will use the GEM operating system from Digital Research, Inc. (mentioned in this month's editorial).

Although the GEM operating system looks superficially like the Macintosh operating system, Atari's GEM-based computer is not compatible with the Macintosh. Furthermore, the Macintosh has better software and more third-party support than GEM. Tramiel has an uphill battle ahead of him if he hopes to compete against the mighty Mac.



MAC-IN-THE-BOX

In the October 1984 issue of *A+* I reported that John Sculley, president of Apple, purchased several MacColby computers.

The MacColby, from Colby Computer of Palo Alto, California, is a genuine Macintosh computer that is rebuilt into a Compaq-style carrying case. The case provides space for two disk drives and other hardware, such as the 10-megabyte HyperDrive or Colby's own 20-megabyte internal hard disk.

Unlike the regular Mac, the MacColby can fit under an airline seat, and it protects the video screen from being cracked or smashed. Colby sells a first-rate foam-padded nylon-and-leather carrying case that adds further protection. The MacColby is available either as a complete computer or as a low-cost kit for converting your own Macintosh into a MacColby.

Chuck Colby, president of Colby Computer, kindly lent a MacColby to *A+* for our journey to COMDEX last fall. Our MacColby had all the trimmings—two disk drives, 512K of RAM, an internal modem, 12-volt power-input jack for operating from a battery or motor vehicle, and even a video-output port for connecting an external monitor or video projector.

Although the MacColby is not quite as cute as the original Mac, the unit we had was a real dream machine loaded with extras. The MacColby seems ideal for salespeople, marketing reps, and others who are frequently taking their show on the road. Having all the add-ons in one package makes packing easier and prevents tragic accidents, such as forgetting the modem, the second disk drive, or a critical cable. +

TEKNIKA MJ-22

...the only color monitor that can show a clear 80-column display with or without an RGB interface board because it is equipped with separated video.

YOU'LL SAVE UP TO $250 ON THE COST OF AN RGB BOARD!

1 Compare colors. The MJ-22 gives you 16 true colors of unsurpassed brilliance. And unlike many other monitors, all colors are accurate. Brown is brown, yellow is yellow, light red is light red—there are no approximations.

2 Compare readability. The .5mm fine slot pitch of the CRT produces clearer, more legible text, especially in the 80-column mode. And, because of the precise slot convergence, you get a clear, sharp image instead of the usual multi-color fuzziness.

3 Compare the gray scale. You get four shades of gray on the MJ-22—not just two or three that other monitors produce.

4 Compare linearity. There's hardly any distortion on the MJ-22. You get more accurate charts because verticals are vertical, horizontals are horizontal, circles are circles.

5 Compare versatility. No matter what Apple you own now, or step up to in the future, the MJ-22 will produce 16 vivid colors, high resolution graphics and 2,000 clearly legible characters.

6 Compare sound. The MJ-22 has a built-in speaker and amplifier right up front for the highest quality sound.

7 Compare screen size. The MJ-22 has a full inch more usable space than other 13″ monitors.

8 Compare cost. Dollar for dollar, the MJ-22 will outperform any other monitor in its price range—and many costing far more.

For the Apple II, II+ or IIe, Teknika's MA-RGB7 color board will enhance resolution and sharpen graphics. Or, you may use the MJ-22 in composite/separated video to start with, then step up to RGB in the future.

The Apple IIc can be used in the composite/separated video mode to start with. Then you can step up to RGB when the RGB interface box becomes available.

Apple III has a built-in RGB board. All you need is Teknika's interface cable, MA-23.

Visit your nearest Apple dealer and ask for a demonstration.

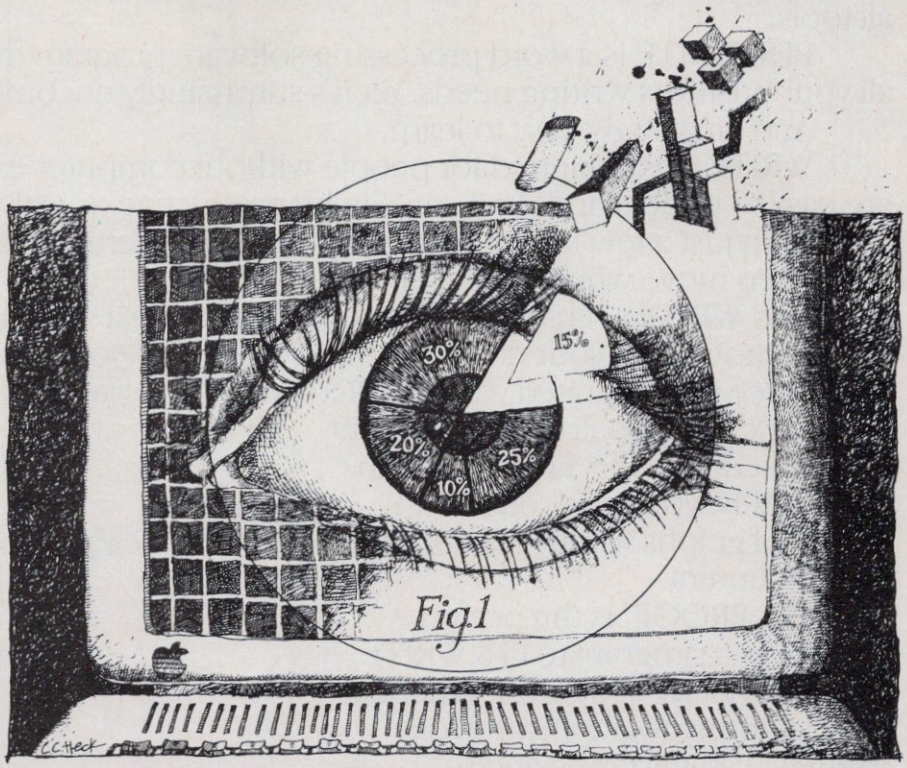
Presenting information graphically on your Apple

THE VISUAL ADVANTAGE



Personal computers have made facts and figures easy to turn out in an ever-larger volume, but they haven't made it very simple for recipients to read your reports. That's why you need presentation-graphics software—these packages can help save people from the growing tide of computer-generated numbers by showing complex data in a form that quickly and efficiently conveys a point.

Graphics are definitely not, as some people still seem to believe, a luxury. In scientific terms, a growing body of evidence indicates that visual routes to knowledge exist that do not involve words. In practical terms, you can see that reports with better visuals are read and acted on more often and more quickly. In fact, I once met a data-processing manager who told me that people in his office were coming in on their own time to use the graphics programs on a Lisa. The employees were willing to go to the extra trouble because they had realized that visually supported reports were significantly more effective.

Apple computers have always been strong on graphics, so it's no surprise that Apple owners can turn to a variety of programs to produce charts and graphs. If you have a Lisa or Macintosh, you have a machine that was designed, right from the start, to work with visual as well as textual metaphors.

The earliest graphics programs for Apples were called analytic graphics—they were designed for the benefit of users, rather than for showing data to others. If you were an early Apple user, you might even have written a few graphics programs in Applesoft to make better sense out of your budget, lab-test results, or financial trends.

When VisiCalc and similar popular spreadsheet programs brought in whole new waves of users who wouldn't or couldn't or just didn't have time to write their own programs, it quickly became obvious that spreadsheet numbers weren't always a good way to communicate results. In response to this realization, VisiCorp, then in its prime, brought out VisiPlot and VisiTrend/Plot; Apple brought forth Apple Plot; Software Publishing offered PFS:Graph; and a host of other firms produced similar packages.

Graphics are definitely not, as some people still seem to believe, a luxury.

The essential purpose of these first-generation business-graphics programs, as well as of their updated current equivalents, was to take series of numbers from spreadsheets and show them as scaled and labeled charts and graphs. The results were far better visually than the original spreadsheets had been, but still nothing to give a competent art department any competition.

The underlying assumption of these products was that you were a spreadsheet user who just happened to be looking for another way to show the results of your calculations. These programs were set up to accept data from spreadsheet files, with several varieties of graphs as their principal output.

Even though some of these first attempts were unpolished, they still carried visual impact. A list of increasing numbers was no match for a graph of an ever-rising line. A breakdown of sales by district lacked the quick information-transfer power of a pie chart, even though it might have offered greater precision. A statement of correlation coefficient was far less convincing than a scatter plot showing a visible clumping of points. People in

CATHY HECK

IT DOESN'T HAVE TO BE COMPLICATED TO BE POWERFUL.

The pen has always been one of the most powerful ways to exchange information and ideas. Yet it's one of the least complicated of all tools.

PFS®:WRITE is a word processing software program that's powerful enough to meet all your business writing needs. Yet it's surprisingly uncomplicated.

And amazingly easy to learn.

WRITE was designed for people without computer experience. So all instructions are easy to understand. And you can be productive quickly.

With just a few keystrokes, you can make insertions and deletions, create bold face type, even move whole blocks of text.

And WRITE's screen is designed to resemble a standard sheet of paper. So you'll always know what your document will look like *before* you print.

Since it's integrated with the PFS Family of Software, WRITE also gives you the power to produce personalized form letters when used with PFS:FILE. And with PFS:GRAPH, you can produce a variety of graphs within the body of any document.

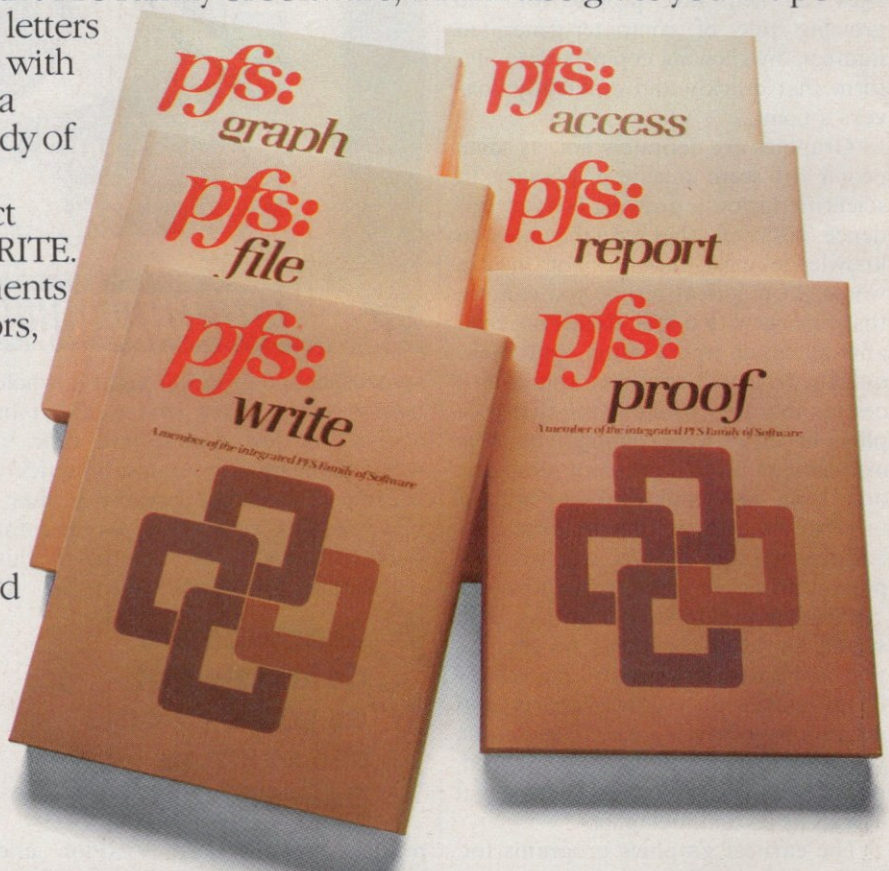
PFS:PROOF* is the perfect companion program to PFS:WRITE. PROOF checks WRITE documents for spelling, typographical errors, irregular capitalization and repeated words. And makes the necessary corrections for you.

All with just the touch of a key.

You can even add words beyond PROOF's 100,000 word dictionary if you need to.

PFS: It's the powerful software that's simple to learn. It's the power of simplicity.

See your computer dealer for more details.



PFS SOFTWARE THE POWER OF SIMPLICITY

business quickly found that graphic output was a necessary adjunct to the personal computer's number-handling capability.

As a result, many large businesses commonly used a spreadsheet to generate a set of numbers, then a graphing program to plot the results, and finally the corporate art department to turn the graphs into something suitable for a report or a public presentation. The graphics programs did the mathematical labor, but they weren't always up to the aesthetic requirements.

Visual Design

Current presentation programs are moving beyond this stage. Although the mathematical routines are still there and an accurate graph is just as important as it ever was, most programs now

The mouse and tablet make the computer more like a brush and a knife.

aim at producing immediately usable, professional-quality output. You still can't buy artistic talent on a disk, but you can find programs that treat the plotting of points and lines as just one step in a process of visual design.

If you were paying much attention to small computers in the middle 70s, you know that Apple didn't invent the personal computer. What it did was make it significantly easier to use; relatively inexpensive; and, most important, able to use color.

The new programs and devices for presentation graphics can't do anything that you couldn't get done before, but this new generation does bring easy-to-use, affordable color tools to the process. The availability of these tools should bring about a veritable explosion of graphics in business communications.

Starting with the input side, you certainly have more options to choose from than you did just a few years back. The mouse, largely because of Apple's efforts, has become a standard input device for graphics programs, even on computers such as the IBM Personal Computer, to which it has to be added as an afterthought. Graphics tablets have also had a renaissance, with Apple's own model rereleased in an FCC-approved form, and a range of low-cost models such as Koala Technologies' KoalaPad appearing on the scene.

For casual users, these simple input devices mean that programs are easier to use, accepting positional input rather than just numeric values entered from the keyboard. You can just point to the destination of each element of a drawing.

The mouse and tablet make the computer more like a brush and a knife. Pointing devices make more transferable a whole range of nonverbal, nonkeyboardable skills that depend on the links between eyes, hands, and brain, to which words are not a party.

By the time you read this column, several firms should have delivered inexpensive video digitizers for the Macintosh and other personal computers. This type of product expands the graphic-input options, in this case to a whole world of existing and fleeting imagery.

Output

On the output side, the change has also been dramatic. Plotters have come down in price to a level most businesses and many individuals can afford, and ink-jet and thermal printers now provide sufficient resolution for striking graphics output.

Pen plotters are still the preferred output devices for presentation graphics when resolution is important. If the software can keep track of the numbers, even a low-cost plotter can produce output accurate to better than one part in a thousand. A plotter can draw smooth lines (although more so for rectilinear shapes than for curves or diagonals), a talent that even the best printers sadly lack. Using multiple pens, plotters can add as many layers of color as clarity and software permit.

The first pen plotters for personal computers used a single pen at a time, and the software prompted you when you needed to change the pen for multicolored drawings. Most of the plotters in the current crop use multiple pen turrets that allow the plotter to select two to eight pens without manual intervention.

If you make frequent presentations before large audiences, plotters are particularly handy for presentation-graphics output because most can draw directly on the clear plastic of overhead-projector slides, which you'll want to use for overlays and other precision work.

For color results with resolution close to that of ordinary video, color ink-jet printers provide you with a quick output method for graphs and charts. In just a few minutes, a color ink-jet printer can turn out a complete

page of multicolored graphics at an incremental cost of just pennies. You can use the same printer to crank out text, between graphics tasks. Considering such a printer's speed and price, you can put color graphs in everyday business memos.

Laser printers promise detail instead of color, a trade-off that Apple seems to have had some success with on the Macintosh and Lisa. Although Apple hadn't released any details about the graphics capability of its laser printer when I wrote this column, word had it that it would be even better than what you could see on the screen.

The mouse, largely because of Apple's efforts, has become a standard input device for graphics programs.

Hooking up a printer to produce the output of a presentation-graphics package is not always easy. Although Apple is moving to simplify the link between software and the various types of printer hardware, you'll still need a graphics-output card, driver program, or both for many printer/computer combinations.

The Software Is Better

Between the input and output stages, the current releases of presentation software give you better and more powerful features than did the first commercial efforts. Along with basic charting of numbers from spreadsheet or directly entered data, some of the more powerful presentation-graphics systems give you the ability to create billboards, put together slide shows, overlay charts and sketches, combine charts, and assemble complete page formats.

Billboarding and charting capabilities let the verbally and spatially oriented have a crack at graphics. Rather than showing numbers on graphs, these features let you make large headlines or geometrical shape-based charts. You'll particularly like these features if you give talks or draw up organizational charts.

Billboarding, also termed sign making or headlining, lets you take words and phrases, position them on an image, change their type style, underline them, switch to italics, add other forms of emphasis, and then print out the result. If you've used MacPaint on a Macintosh, you've probably found out how easy it is to whip out a sign or a title page by combining the alphabetic mode and some lines and boxes.

MacPaint is probably one of the easiest programs to use, but some of the packages developed for the II family are even more advanced. In addition to basic line-by-line formatting, some programs add commands, such as centering, justification, and tabs, that are common in word-processing programs.

Slide shows let you turn your computer from rehearsal hall to performance theater. In this application, you build up a series of graphic images and then tell your system to display them in succession, on command. You can put the result to work as a training tool, sales demo, or paced graphics support for a live talk.

Many packages for the Apple II series now include slide-show capabilities, ranging from the ability to summon screen images from disk, one by one, to features that approach a cross between animation and CAD (computer-aided design). The IIe and IIc with double-hi-res graphics make particularly good color-slide-show machines.

Slide shows let you turn your computer from rehearsal hall to performance theater.

If you need this kind of capability but can settle for black and white, the Lisa and Macintosh can also present sequenced images. You won't find much yet in the way of commercial software, but if you like to write your own, you'll see that Macintosh Pascal has a great set of interactive graphics commands.

Even if all you want to do is graph numbers, you'll still find that current presentation software is a step up from its predecessors. Microsoft Chart, for example, lets you pick from more than half a dozen different types of bar charts, five area charts, seven line charts, six pie charts, five scatter plots, and probably even more.

All these capabilities may seem complex, but they really aren't—if I could only show you a diagram, it would be a lot more obvious. ✚

THE DEBIT CREDIT CONNECTION™

A Personal and Small Business Accounting Software Program

ARE YOU LOOKING for an accounting software program that is written to make life easier for YOU (not the programmer) and provides you with the POWER to manipulate and study your financial records from virtually any angle? **YOU HAVE FOUND IT !!!**

THE DEBIT CREDIT CONNECTION™ is a VERY FAST and EASY to use double entry accounting software program based on the process of transferring money from one account to another (probably the same system you already use). For example if you write a check for groceries you are taking the money out of your checking account and putting it into your food account. PRETTY SIMPLE RIGHT? Well that's exactly what this program is all about. See the words Debit and Credit in the title of this program. Look again because that's the only place you will see them. This program uses phrases like "TAKE MONEY OUT OF" and "PUT MONEY INTO" (remember the program is written for YOU not a CPA

PRINT CHECKS? You bet, with name, address and account number, even itemizes each entry.

SPLITTING a transaction between several accounts is a breeze. The program will even type in most of the information for you. Every transaction has 58 spaces for the DESCRIPTION OF YOUR choice. In most cases that's enough to satisfy the IRS's 6 W's (who, what, when, where, why and WHOW! much).

NEED A FINANCIAL REPORT? Select the report you want and the program will AUTOMATICALLY do the rest. When you return the report will be waiting for you.

A picture is worth a thousand words so HIGH RESOLUTION GRAPHICS of all balances is provided. That's not all, the program will even draw AUTOMATED and CUSTOM CHARTS.

The thought and detail that went into this program cannot be described with words it must be EXPERIENCED. Send for your copy today. **YOU WILL LIKE IT !!!**

THE ULTIMATE SHOPPING MACHINE™ and RANDOM DINING™

A software program designed to take the hassel out of meal planning and shopping for the busy household, restaurant or small institution.

RANDOM DINING™ will QUICKLY (2 minutes) generate a list of menus (3 meals a day from 1-31 days) based on how difficult a meal you want to prepare and then compile a list of all ingredients needed. Those menus will be what you want not what someone else has preprogrammed.

THE ULTIMATE SHOPPING MACHINE™ program will create an inventory system for your entire shopping needs including those non food items that make up 40% of your shopping trips. The printed list of products, prices and quantities you really need is arranged just like the stores you shop in.

WHAT A PLEASURE to have the computer handle the repetitious busy work so you have more TIME and MONEY for the important things in your life.

FEATURES:
- Prints a shopping list of needed items, including quantity and price and arranged like the stores you shop in
- Inventory check list
- Keeps you aware of price changes and real bargains
- Handles multiple stores
- Always reminds you of your needs
- Moves products from category to category
- Use for food, drug store, hardware store on same list
- Keeps recipes on file
- Converts serving sizes instantly
- References cookbook name and page
- Copyable and hard disk drive compatible
- Search by ingredient
- Hard disk compatible

CAPACITIES
- 300 Recipes
- 30 Categories
- 900 Products, Prices, Quantities

Beagle Bros Apple® Software Report

Ad Number 181 — *"All the News That Fits"* — *Fall/Winter 1984*

"How can I make *my* Apple® do that?"

You know, you *can* make your Apple do almost anything you can think of, with just a little help—Beagle Bros software helps make your Apple a more powerful computer, and *you* a better programmer.

BEAGLE BROS, THE UTILITY LEADERS: Beagle Bros' low-priced unprotected disks dominate the Apple Utility bestseller lists. And Beagle disks were recently voted to **FOUR of the TOP-24** spots in *Softalk's* "Most Popular" poll— that's against *all* Apple software publishers in *all* categories.

APPLE'S SECRETS REVEALED: Our authors are always on the lookout for techniques and tips that can be shared with our customers. From our inspectable programs to our informative instructions and Apple Tip Books, you will learn from the experts. And you don't have to be an expert to start. For example, type in this little program, and then type "RUN" ☞ *10 HGR: POKE 228,99: HPLOT 0,99 TO 279,99* A-*ha!* You just drew a *dotted line* on the hi-res screen. A secret technique? Not any more.

NEW!

BEAGLE GRAPHICS™

16-COLOR DOUBLE HI-RES GRAPHICS

$59.95 (DOS 3.3 *and* ProDOS™, requires Apple IIc or 128K IIe)

16 colors and 560x192 resolution on your IIc or 128K IIe! Beagle Graphics is *packed* with features:

As an Artist, you can draw, FILL and label double hi-res pictures using the AppleMouse™, joystick, Koala Pad™, graphics tablet *or* keyboard.

Icon-assisted "Cut & Paste" features make graphics manipulation easy. Any section of a picture can be stored, moved, inverted or flopped.

As a Programmer, you get 33 new commands for drawing, filling and manipulating double-res images. New utilities let you convert normal programs & pictures to double-res, save and load any image section, compress picture data to 1/3 disk space, produce double-res "slide shows" and more.

Label your double hi-res pictures with a variety of editable normal-size and double-wide typefaces.

NORMAL HI-RES (*see Alpha Plot below*) — 280 PIXELS, 6 COLORS

DOUBLE HI-RES (*see Beagle Graphics above*) — 560 PIXELS, 16 COLORS

ALPHA PLOT™

STANDARD HI-RES GRAPHICS UTILITY

$39.50 (DOS 3.3, compatible with any version of Apple II)

Alpha Plot lets you draw in hi-res on both pages using easy keyboard commands. Pre-view lines before plotting. One-keystroke circles, boxes and ellipses, filled (solid/mixed) or not. All pictures are Save-able to disk for access by your programs.

Compress hi-res data to 1/3 disk space, allowing 3 times the number of hi-res pictures per disk.

Superimpose pictures or relocate sections of images anywhere on either hi-res page.

Add variable-size color text to pictures. Type anywhere on the screen, even *sideways* for graphs.

PRONTO-DOS™

TRIPLE-SPEED DOS 3.3 UTILITY

$29.50 (DOS 3.3, compatible with any version of Apple II)

ProntoDOS *triples the speed* of loading and saving pictures and programs. Compare speeds:

Function	Normal	Pronto
BLOAD HI-RES IMAGE	10 sec.	3 sec.
LOAD 60-SECTOR PROGRAM	16 sec.	4 sec.
SAVE 60-SECTOR PROGRAM	24 sec.	9 sec.

(Text files no change)

MOVE DOS 3.3 above main memory to free 10,000 bytes of memory (64K required to move DOS). Get 15 extra free sectors per initialized disk too.

New TYPE command *("TYPE filename")* immediately displays your Apple text file contents.

NEW!

FATCAT™

DISK LIBRARY ORGANIZER

$34.95 (compatible with any version of Apple II)

Fatcat reads all of your DOS 3.3 and ProDOS disk catalogs into one or more "Master Catalogs" that can be searched, sorted and printed. Update at any time by simply reading in new or altered disks.

Fatcat also lets you quickly compare any two files and **alphabetize file names** in your catalogs.

APPLE MECHANIC™

HI-RES SHAPE ANIMATION

$29.50 (DOS 3.3, compatible with any version of Apple II)

Apple Mechanic lets you draw shapes on the screen which are converted into "shape tables" so your programs can perform animation with Apple's built-in Draw & Xdraw commands.

Easy-to-follow "List & Learn" demos on the disk teach how to program in Hi-Res.

Fancy typefaces are another big part of Apple Mechanic. Six proportionally-spaced fonts are included on the disk, with 26 more on our **Apple Mechanic TYPEFACES** disk, sold separately.

NEW!

TRIPLE-DUMP™

"PRINT-ANYTHING" PRINTER UTILITY

$39.95 (DOS 3.3 *and* ProDOS™, compatible with any version of Apple II)

Triple-Dump lets you print any kind of image on your dot matrix (graphics-capable) printer:

❶ Hi-Res & Double Hi-Res graphics. ❷ Lo-Res & Double Lo-Res graphics. ❸ 40 & 80-Column text.

Triple-Dump's print routines can be run directly from the disk, or included in *your* programs.

Also included is a bonus GIANT BANNER program that makes 8½" high signs on *any* printer.

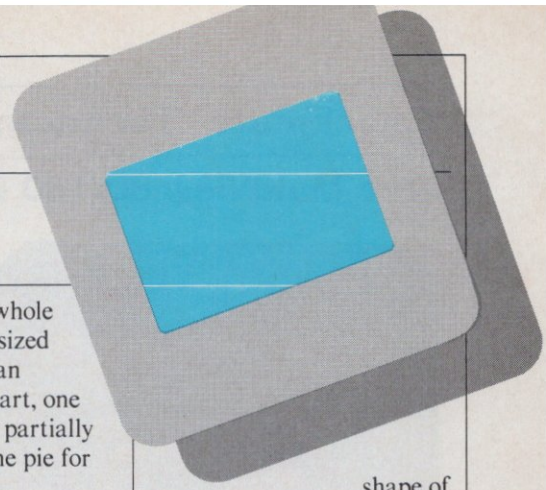
PRESENTATION GRAPHICS



▸ APPLEWORDS
BY STEVE ROSENTHAL

A short glossary

ANALYSIS
In reference to charts and graphs, ones designed primarily to help users make sense out of data (as compared to presentation graphics, which are intended to help others see the user's view).

AREA
A type of chart that shows values as the area under a line or curve. These charts often show cumulative growth, such as population, total profits, or products shipped.

BAR CHART
A popular type of chart for presenting data. A bar chart shows a value as the length of a horizontal bar or height of a vertical one. Usually, bar charts show multiple series of comparative values on a single chart. Popular types include clustered, stacked, three-dimensional, and flat.

CLUSTERED BAR
A type of graph that shows comparative values as adjacent sets of bars at each interval, with one bar proportional to the length of each of the quantities being graphed. Normally, bars for each series of values are shown in a distinct color or crosshatch pattern.

DIF
Short for Data Interchange Format, a file format created by Software Arts to enable its VisiCalc program to exchange data with other programs. Most popular spreadsheet and database programs can optionally produce DIF files, and most presentation-graphics packages can accept DIF files for input.

FLOAT
To move text or other nonscaled elements around on a chart. A float capability allows you to adjust the titles and legends on your charts for maximum legibility.

FOIL
A transparent slide for overhead projectors. Most plotters can draw directly on foils, either with their normal pens or with special surface-drying markers.

HATCH
Strictly referring to a pattern of crossed lines, this term commonly refers to a range of patterns made up of lines and dots for shading charts and graphs. To show complex charts on a monochrome display or with a one-color printer, you need hatch capability.

LEGEND
An explanation of symbols or hatching patterns on a chart or graph. Most presentation-graphics packages let you place a clear legend on your graph, often letting you format it for maximum readability.

LINE GRAPH
A common type of graph that shows the graphed values as a set of points connected by lines. Some packages let you choose between connecting the points, on one hand, or fitting the curve or smoothing the line to emphasize the overall trend rather than the individual points.

PEN COLORS
The separate colors that a graphics program can display, either on a screen or on an output plotter or printer. Typically, a presentation-graphics system can handle between one and a dozen pen colors.

PIE
The type of chart that shows constituents of a whole as proportionally sized slices of a pie. In an "exploded" pie chart, one or more slices are partially pulled out from the pie for emphasis.

PLOTTER
An output device that draws continuous lines on paper or other flat material. Many printers can show graphics displays made up of a series of closely spaced dots, but you can get more precise and attractive output with a plotter. Most graphics programs for the Apple can produce black-and-white output with a printer or a color result with an Apple Color Plotter or a similar model from another vendor. A plotter is relatively slow, because it must produce each line and curve individually, but it is the best output device for professional-looking results.

PRESENTATION GRAPHICS
The display of information in a graphic form to make a clear, quick, effective point to other people (in contrast to analytic graphics, intended to help users analyze their own data).

PREVIEW
To check graphics output on a screen before printing or plotting it. Although even a good color monitor can't show a graph in as much detail as a plotter can, having preview capability allows you to check the overall look of your graphs without waiting through the slower hard-copy process.

SCATTER
A type of graph that shows values as individual dots in relation to a set of axes. Values that are more frequent appear as darker clusters of dots, and the shape of darker regions can show overall relationships. This type of chart is variously called a scatter chart, scattergram, and scatter graph.

SLIDE SHOW
In a computer context, a computer controlling a series of prepared graphics, either unattended at fixed intervals, or on command. Just like their photographic equivalents, computer slide shows are used for presentations, training, and sales demonstrations.

SMOOTH
To apply a mathematical transformation to data points before graphing them, to lessen the effect of extreme changes. Smoothing can bring out trends that would otherwise be masked, or, of course, it can mask inconvenient details.

STACKED BAR
A type of bar graph that shows not only an overall quantity as the total length of a bar, but also the constituent parts as sections of the bar in different colors or crosshatching patterns. For example, a bar chart showing total sales might display each bar as a composite of segments that show sales for each region.

TEXT PLOT
Images made up of lines of text. Most of the more advanced presentation-graphics systems let you create titles and lines of text in a variety of type styles and sizes. This capability is most useful for making overhead slides. +

Show your colors.

The new Epson® JX-80™ 7-color printer.

Say more faster. With greater clarity and comprehension. And with a lot more impact. Say it in color.

Join the color revolution.

The revolutionary JX-80 gives you seven vivid colors to breathe life into charts and give soul to text.

But that's just for starters.

The JX-80's exclusive SelecType control panel makes choosing and mixing any of nine popular typefaces (the JX-80 prints 144 different faces in all) as easy as pushing a few buttons *on the printer.*

Color it hot.

The JX-80 prints graphics or text in black and white at speeds of up to 160 characters per second exactly like our legendary FX-80™ dot matrix printer. So, like all Epson printers, it's supported by virtually all software and personal computers. Switch to color, however, and the JX-80 is supported by all popular *color* software such as Lotus® Symphony.™

And of course, the JX-80 is backed by the one-year Number One Warranty, and priced right.

CIRCLE 447 ON READER SERVICE CARD

You've just had a brilliant idea, one that will increase the sale of widgets, your company's principal product, by at least 20%. You're certain you can convince the president and the board of directors that it will work, with a presentation. Time to get out the poster board and markers? Wait—this is the computer age; let your Apple help you sell your ideas.

Presentation Graphics

Speakers, trainers, teachers—anyone who wants to present information in an effective way—can use presentation graphics. Large organizations usually have graphics or audiovisual departments to create presentations; but even in large companies, personal-computer graphics offer the advantages of speed and personality. You create the graphics when you need them (revisions are instantaneous), and they reflect your exact intent.

Your presentation can comprise a series of computer-graphics creations that you show on your Apple computer to a passive audience or to an audience that interacts with the computer via keyboard, light pen, or touch screen. You can also use your Apple to create a 35mm slide show, a printed booklet or portfolio of papers, a videotape, or a combination of these options.

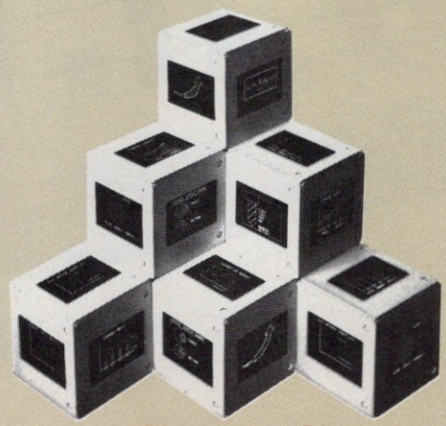
You can use any computer program that creates full-screen images to create presentation graphics.

This article focuses on two aspects of presentation graphics: creating the graphics and presenting what you have created. Although we concentrate on the Apple II series of computer, the basic concepts also apply to the Apple-32 series. (See "Making it on the Mac," page 28.)

The planning process is the most difficult and the most important part of preparing presentations. Ask yourself these questions: What is my objective? What do I want to present? Analyze your audience. Then make an outline of the material you want to cover and decide how serious or humorous your approach should be. Next, write a brief script. Finally, to visualize your ideas, create a storyboard.

The Storyboard

A storyboard—a sequence of sketches of each visual in the presentation—functions like a map that helps you get from here to there. Decide on the number of visuals you need, keeping in mind that it's better to have many simple screens than a few complex ones. You don't want to distract your viewers with a visual that is cluttered with symbols and/or words. It's wise to limit each image to one main idea, and if you include screens of text, limit the number of words on each screen—ten to fifteen words is the maximum.



You create the graphics when you need them (revisions are instantaneous), and they reflect your exact intent.

Armed with a well-thought-out storyboard, you're ready to develop the graphics. Since many presentations involve numerical data, you probably want to create some charts or graphs, and for this task, you need a business-graphics package.

Business Graphics Packages

Business-graphics packages create labeled charts and graphs from raw data. They should accept data from a spreadsheet, database program, or other business program that uses a standard data format. Most business-graphics programs accept DIF (Data Interchange Format), Sylk, or standard ASCII (American Standard Code for Information Interchange) files. Even if the data formats are compatible, you may have difficulty transferring data between different operating systems. If, for example, you are using a CP/M database program such as dBASE II and an Apple DOS 3.3 business-graphics program, you'll have to convert to the appropriate operating system. A good business-graphics program should allow you to hand-enter the data when the file is not easily transferable.

Business-graphics programs should give you a choice of graph type—bar, pie, or scatter/line. You choose the best type of graph for your data, possibly trying different graph types before se-

lecting which one best communicates your message.

Many graphing programs support continuous data on one axis only. If you work with scientific data, you may need to plot continuous data on both the x-axis and y-axis. Programs such as Scientific Plotter specialize in scientific plotting and may be a better choice for you than a business-graphics program.

Some programs, such as Multigraph, are equipped to perform complex mathematical calculations. This ability allows you to shuffle data, make predictions, and see the results.

If you need to create charts—such as flowcharts, floor plans, or circuit diagrams—rather than graphs, consider a specialized charting package such as Charts Unlimited.

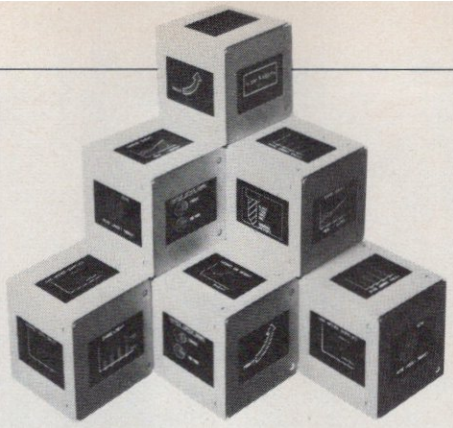
Keep your graphs simple. Line graphs are especially risky—it's easy to plot line after line, until the image looks more like a bowl of spaghetti than a graph. If you need more than three lines, create several graphs and add one line to each succeeding graph. You'll be showing them in succession, in any case, and the viewers will be able to focus in on the changes to each graph—i.e., the new lines—rather than trying to decipher a tangled mass.

All business-graphics programs allow you to label your charts. Some provide flexible labeling options such as "floating labels," which can be moved anywhere on the graph; vertical text; and a choice of fonts and symbols.

Pumping Up Your Presentation

Once you have the charts and/or graphs that form the core of your presentation, you can enhance the presentation by creating pictures, text screens, or title screens. For example, you may want to illustrate a bar chart of fruit sales with pictures of fruit. You may want to fill a pie chart with interesting color patterns or label a bar chart with a bold display font. These extra touches create presentations that are uniquely yours.

Unless you are using The Graphics Department—which contains a complete set of graphics utilities, including a lettering module—you will need a good Apple graphics package. Most business-graphics programs create standard 8K Apple pictures, so you can load your charts into any graphics package for further enhancement. Use a graphics package that has a diversified color palette, a choice of fonts, and editing utilities. The Complete Graphics System or the Digital Paintbrush System are two examples. For an extended choice of fonts to create title pages and text screens, we recommend Apple Mechanic or Fontrix.



Line graphs are especially risky—it's easy to plot line after line, until the image looks more like a bowl of spaghetti.

▸ MAKING IT ON THE MAC

If you have a Macintosh or a Lisa, you can create your presentations using Microsoft Chart, MacPaint, MacDraw, or LisaDraw. The planning, scripting, and storyboarding phases are the same as those for the Apple II series of computers, but creating the graphics is far easier on your Mac or Lisa. Take advantage of the many clip-art programs that have appeared for these machines, such as The Art Department for the Lisa, and McPic, DaVinci, and Mac the Knife for the Macintosh (see *A+*, October 1984, page 98).

After creating the graphics, you can print, plot, or photograph the screens for presentation purposes. Although we have not yet heard of any company that creates 35mm slides from the Mac or the Lisa, you can create a computer-based slide-show program with The Slide Show Magician.

If the monitor of the Macintosh is too small for your presentation, Professional Data Systems sells a Macintosh that is modified so that you can plug it into a large video screen. This company can also convert your Macintosh with its Mach I or Mach II System. Be aware that the Mac's high resolution does not translate well to a standard video monitor. For high-quality large-screen presentations, you'll need a high-resolution (high-bandwidth) monitor.

The Imagewriter turns out excellent hard-copy presentations, but, even better, companies such as Manhattan Graphics produce exceptionally fine, professionally typeset material from Macintosh documents.

When you have completed your graphics, you'll want to assemble them for viewing. Most presentations are either slide shows or printed copy. Three major factors bear consideration when you transfer your computer-screen images to other media.

Aspect ratio—The aspect ratio of a computer screen is 4:3. That is, the screen is approximately one-third wider than it is long. Other media may have a different ratio. The software that translates your image to another medium should adjust the aspect ratio to provide an image comparable to that on the screen. Pie charts are most dramatically affected—pie charts without aspect-ratio correction become ovoid charts.

Resolution—The resolution of the Apple graphics screen at 280 pixels horizontally × 192 pixels vertically creates jagged lines and typefaces. Printouts and slides taken directly from the Apple screen reflect these "jaggies."

Color—Be especially careful with color; some Apple colors do not work well with other colors. It's impossible, for example, to plot an orange bar next to a green bar everywhere on the screen. Similarly, a blue bar next to an orange bar often yields an unwanted white line between the bars. Some colors are indistinguishable from others in black-and-white printouts. Programs such as Apple II Business Graphics and The Graphics Department let you experiment with the colors until you achieve satisfactory results.

Slide Shows

To create a computer-based slide show, you need a slide-show utility. Screen Director, Frame-Up, Transitions, or the slide-show utility in The Graphics Department are programs that sequence a series of full-screen pictures when you press a paddle button or key. They can also give you a timed self-running display.

Good slide-show programs provide a choice of "wipes"—transitions between pictures—as well as a method of packing the pictures to allow more than the usual 13 or 14 on a single disk. Some slide-show programs, such as Frame-Up and The Screen Director, include a utility to create simple text slides. Fast-loading routines in some programs load images onto the screen so fast that animation effects are possible.

If you prefer a 35mm slide show, you can have slides made from your Apple screens. The least expensive—and the

most problem-prone—method is to photograph the screen yourself. Even with a tripod and relatively fast film, chances are the slides will be underexposed, overexposed, or distorted. Inexpensive add-ons such as the Kodak Instagraphic CRT Imaging Outfit can help when you photograph the screen, but for effective, professional slides we recommend the following two options. If you plan to use many slides over an extended period of time, invest in high-quality slide-making hardware such as the Polaroid Palette. If you need an infrequent, limited number of slides, send your diskettes of images to Visual Horizons, who will convert your Apple images to professional-quality 35mm slides (see "Turn Your Screens into Slides," page 35).

If printed output more adequately suits your needs, consider acquiring a printer or plotter and additional software.

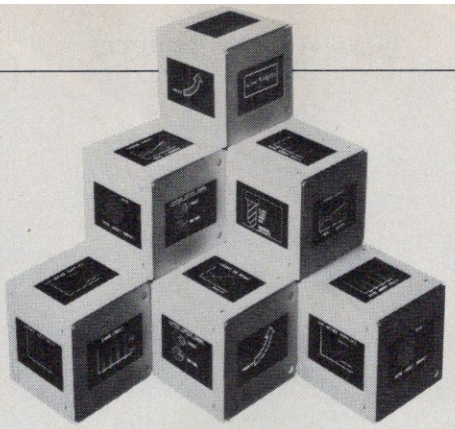
Printers

Letter-quality printers usually produce poor graphics. Dot-matrix printers with graphic capabilities give better results. Some business-graphics programs allow you to dump your screen images to a printer, but they usually work only with specific printers and printer interfaces.

Specialized printer-dump programs—Paper Graphics, the Printographer, and Zoom Grafix are examples—work with almost every printer or printer interface. Paper Graphics and Printographer offer additional bonuses; they allow you to modify the images—before printing them—with such options as cropping, inverting, shrinking, enlarging, framing, packing, and adding text. The main disadvantages of printer-dump software is that you have to quit the program that you are using to create the graphic, and boot the printer-dump disk. After seeing the printout, if you want to make a change in the graphic, you have to reboot the graphics program.

Printer-interface cards, such as Print It and Finger Print, let you interrupt your graphics program to do a quick screen dump and then return to your program.

On a monochrome printer, the colors in your screens translate into patterns, so be sure that the colors you select are distinguishable when printed. Colored ribbons are available for many black-and-white printers, and a program called The Color Printer does a color separation of your image and lets you use colored ribbons with a black-and-white printer to get effective multicolored printouts (see "You Can Print a Rainbow," *A+*, June 1984, page 62). If switching ribbons, registering, and rolling back paper is not for you, a color printer is what you need. Color printers have always been very expensive, but a number of manufacturers—including Canon, Apple, and Epson—have recently introduced more affordable ones. Before purchasing a color printer, find out if the software you use is compatible with it.



If you plan to use many slides over an extended period of time, invest in high-quality slide-making hardware.

Like printers, plotters produce hard copy. Unlike printers, plotters draw fine, smooth lines by dragging a pen across paper. Plotters can't print an Apple screen image; they need instructions to draw the lines. Apple II Business Graphics, among other programs, includes plotter "drivers" that send these instructions to a plotter. For more plotter options, consider specialized plotter software. Prime Plotter is one such program. Inexpensive plotters often let you use only one colored pen at a time, but you can change the pen manually when you want more colors. Plotter commands differ from manufacturer to manufacturer, so be sure the software you choose is compatible with the plotter you have. The Mural "V" Series Plotters draw with ordinary writing pens on any size paper or poster board up to two by three feet.

Overhead Transparencies

Most copy centers can make overhead transparencies from a 35mm slide or printed hard copy. Plotters can draw directly onto a transparency.

Video

Although it's easy to hook your Apple up to a standard television set, the video signal from your Apple is not the standard television signal. You can connect a home or professional videotape recorder to your Apple (through an RF generator) and record the screen image, but you may lose the color, and you won't be able to edit the tape. Hardware such as the Micro Key System from Video Associates, converts Apple video signals into the American standard video signal. Note that the video image this hardware produces does not correct the jagged lines or color problems in the original image.

If you can afford the expense, you can have a videotape pressed onto a videodisc. Interfaces and programming systems from several manufacturers allow your Apple to control the images shown from a videodisc. A big advantage to this type of system is that you can alternate live or still video material with the computer-graphics images. Such presentations are likely to become more popular as the cost of transferring from videotape to videodisc decreases.

Interactive Presentations

You can build interactive presentations—which are controlled by your computer—using computer images alone, 35mm slides, videotapes or videodiscs. Interactive presentations require a program that accepts user input and displays the selected image. Apple Computer's dealer demonstrations of AppleWorks and Apple Logo are good examples of this type of presentation.

▶ FILES

All business programs of any value save information to disk. Different spreadsheet programs, which often look identical on the screen, may save data in very different formats. Even if the data file is composed of standard ASCII characters, the arrangement of the data varies from program to program.

To alleviate some of the problems caused by varying storage formats, Software Arts invented DIF (Data Interchange Format) files for VisiCalc. A DIF file is an ASCII file, but with a clearly defined structure and format. Because the DIF-file format has been widely published, and because VisiCalc is such a popular program, many business programs read and write DIF files even if they normally save their data in another format.

More recently, Microsoft created the Sylk format for Multiplan. If you must transfer data from one program to another, be sure that your programs can read and write DIF or Sylk files.

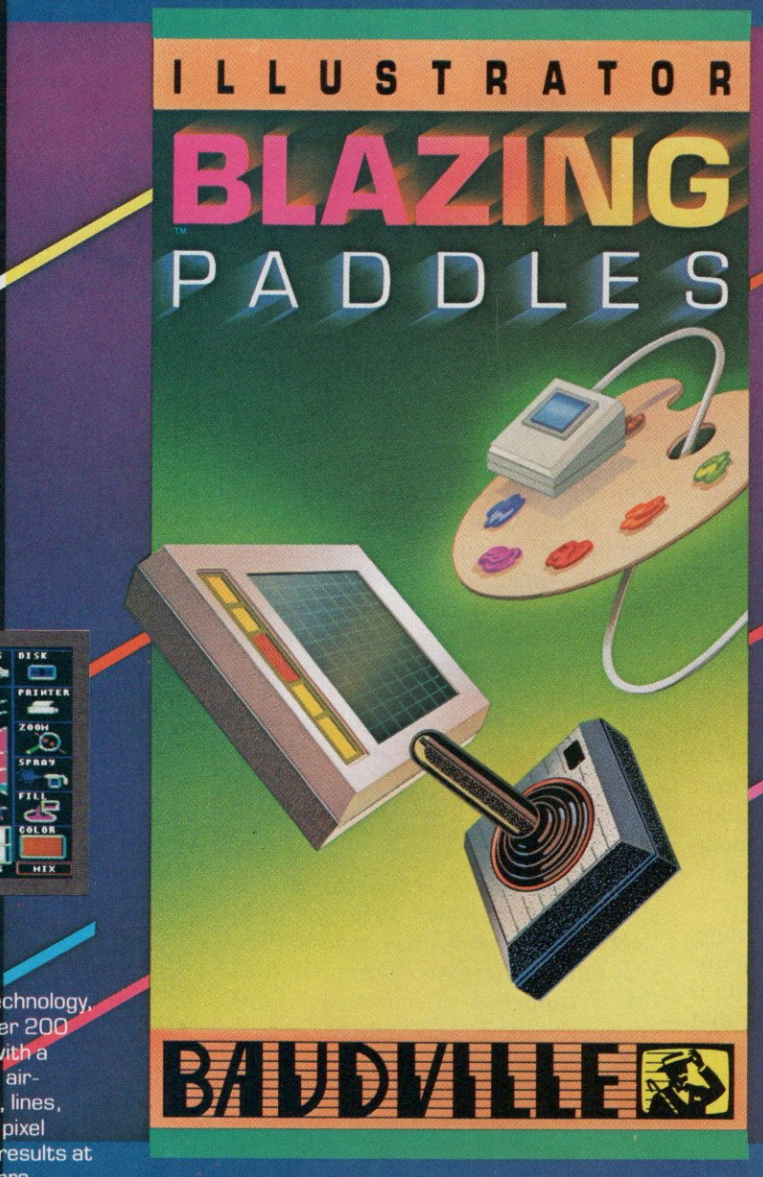
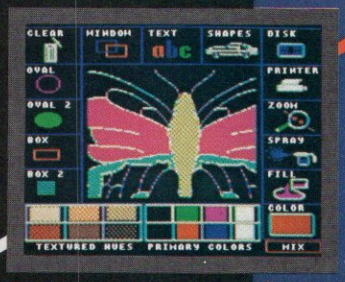
Now You Need...



The All-In-One Illustrator

It draws, paints & prints your high resolution illustrations with ease. Works with any standard input device, including touch tablets, joy sticks, light pens, mice & professional graphics tablets.



Sophisticated Features

State-of-the-Art input technology, color mixing to create over 200 textured hues, painting with a variety of brush strokes, air-brushing, inserting ovals, lines, rectangles. Zoom allows pixel editing while viewing the results at full scale. Text fonts and pre-drawn shapes are included and may be added at any time. A printer dump for most dot matrix printers is included.

Productive Fun

Includes all the artistic tools needed to create striking computer art. So versatile that young children are able to use it like a coloring book, yet sophisticated enough for a computer artist to use. Perfect for Home, Business, Education, and the Art. The possibilities are endless...

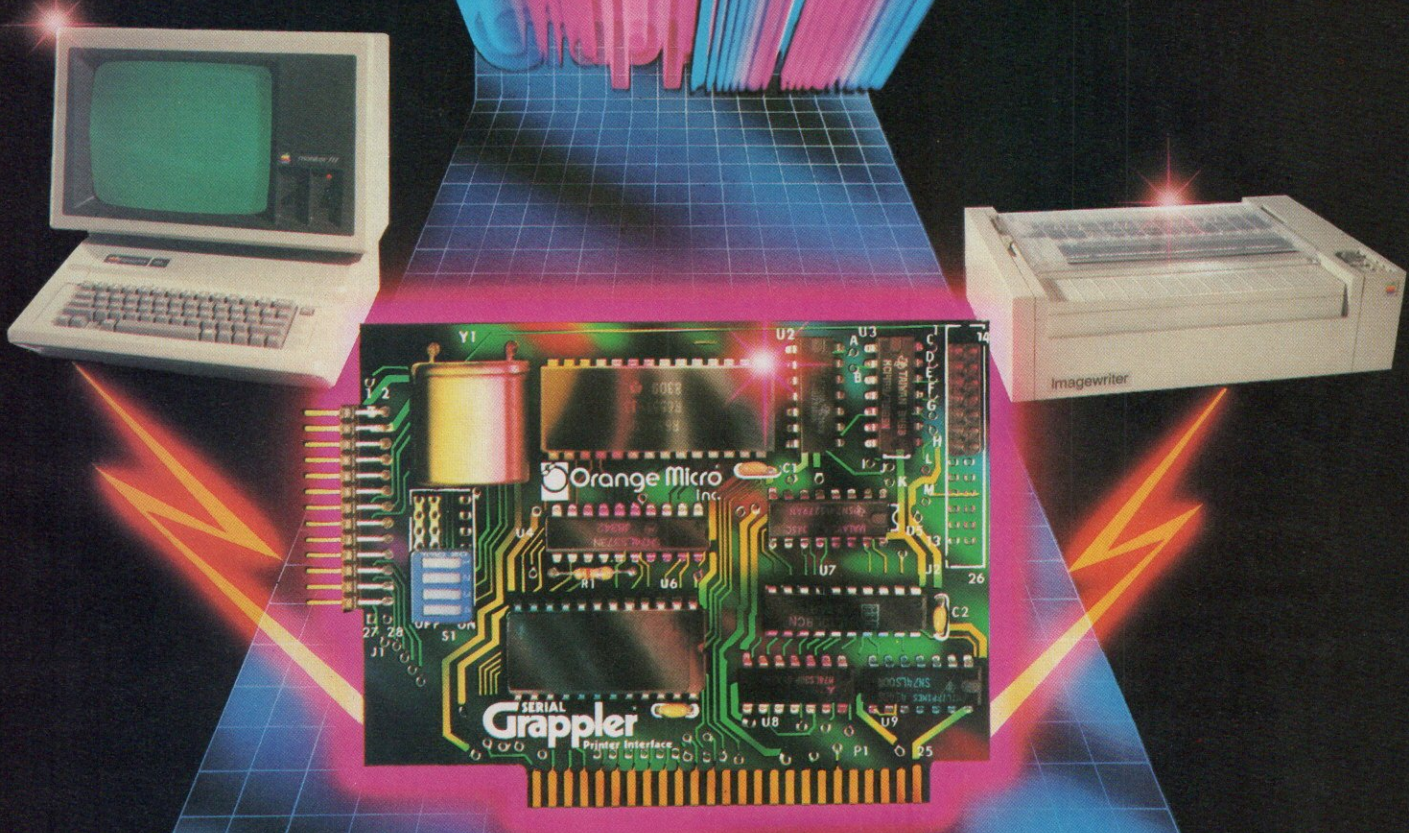
ANNOUNCING THE NEW STANDARD FOR APPLE® IIE'S AND IMAGEWRITERS.™

SERIAL Grappler® Printer Interface



#1 AND COMMITTED TO STAY THERE

Orange Micro's Grappler® products have set the standard for Apple interfaces throughout the world. With over 170,000 units sold, Grapplers are in use with printers from all the major manufacturers.

The new Serial Grappler gives you this same quality and innovation for Apple's versatile Imagewriter, or any Imagewriter compatible printer. When you buy computer equipment compatability is critical, and the Serial Grappler offers the best of both worlds. It's fully Apple compatible, so your software will run without a hitch. But there's more. It's also Grappler + compatible, so all the programs written to use the industry standard Grappler features will run on the Serial Grappler the same way. With the Serial Grappler, your system will work the way you want it to.

With the Serial Grappler you won't need complicated software to print your text or graphics. A few simple keystrokes is all it takes.

In all, the Serial Grappler has over 25 built-in commands for graphic and text screen dumps and text formatting. These include a IIe 80 column text dump as well as exclusive support for Apple's Double Hi-Res Graphics. The Serial Grappler comes complete with an FCC approved printer cable and friendly, thorough documentation. Its superior quality is backed by a full 1 year warranty. What more could you ask from a printer interface?

EXCLUSIVE BUFFERPAK™ UPGRADE OPTION

Orange Micro has set the industry standard again with the Bufferpak, the world's first expansion module for an Apple interface. The Bufferpak plugs directly onto the Serial Grappler, adding a printer buffer with up to 20 text pages of memory. No extra cables, no extra slots used, no extra power supplies, no tricky installations. Just plug it on. Adding the power of buffering has never been so easy.

The Bufferpak comes standard at 16K, and is upgradable to 32K or 64K of memory. In no time you'll be experiencing the time saving benefits of buffering.

Grappler products are available through Apple dealers and computer stores throughout the world. For more information, visit your Orange Micro dealer today.

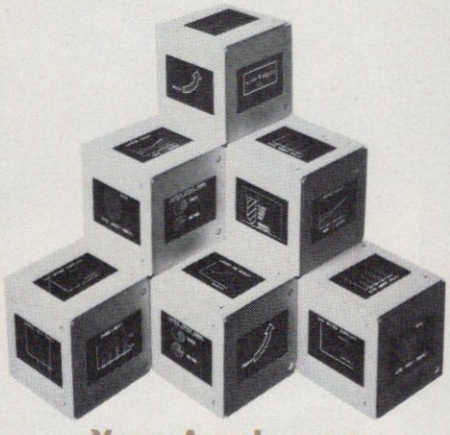
The most sophisticated interactive presentations use light pens or touch screens. These devices allow users to select from a series of options by touching the screen with the pen or finger. One advantage to using these devices is that the computer remains out of sight.

Multimedia

Your Apple can control a bank of videotape players, recorders, and/or slide projectors to create a multimedia presentation. A new hardware product called the Gemini 2002 uses an Apple to create shows involving two to six Kodak 35mm projectors, with tape-recorder synchronization.



Your Apple can control a bank of videotape players, recorders, and/or slide projectors to create a multimedia presentation.

Interactive multimedia presentations can be complicated, and unless you have experience in using electronic media, you probably are better off leaving this approach to the pros.

Summing Up

If you are trying to sell, compare, or analyze a product or a concept, your computer can help you. A well-designed presentation with dynamic graphics often conveys more than does a printed report full of facts and figures, and says it more effectively. So organize your thoughts, create your screens, and let your Apple sell those widgets. ✚

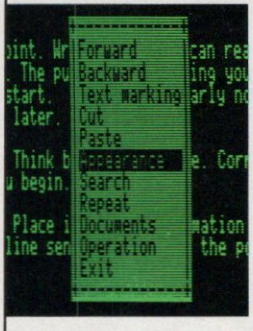
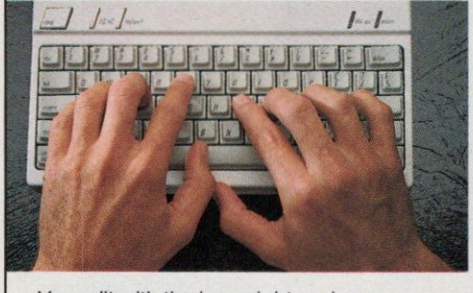
If a Word Processing Program Doesn't Give You These 8 Tools for Better Writing, It's Not Perfect.

1 Pop-up menus—so you can start writing better right away.



Perfect Writer™ pop-up menus use simple English language words. No complicated commands to memorize or slow you down.

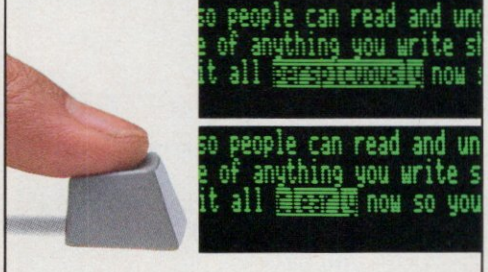
2 Simple function and operation that keeps your mind on what you're writing.



You edit with the keys right under your fingertips. And menus appear right in the workspace with your document.

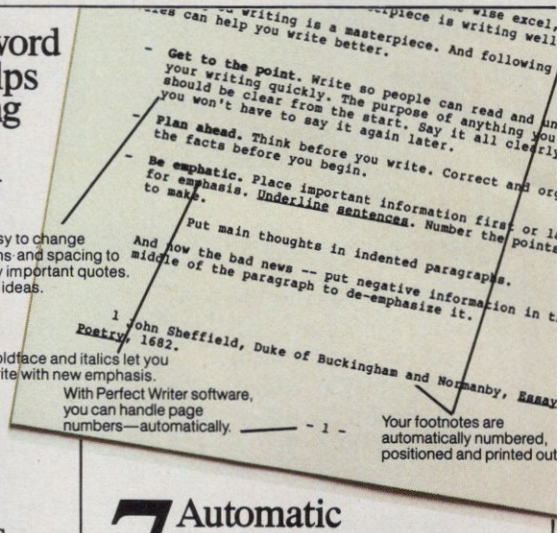
3 Powerful editing features at the touch of a single key.

You can move text. Search and replace. Add or delete words, sentences, even entire paragraphs.



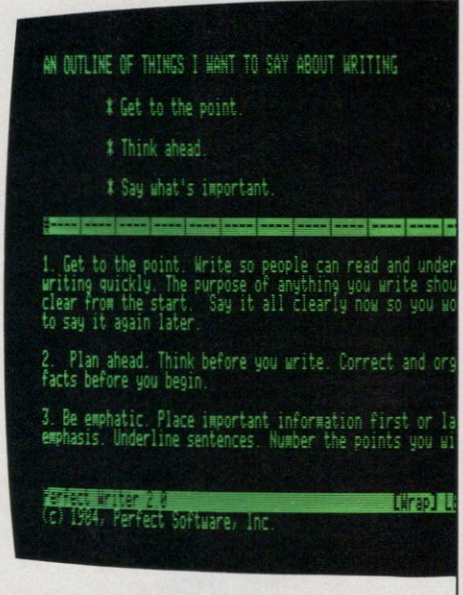
4 A built-in 50,000 word dictionary that helps you prevent spelling mistakes.

The Perfect Speller™ spelling checker scans your document and points out spelling errors. Automatically.



5 A built-in thesaurus to help you choose exactly the right word.

With the Perfect Thesaurus™ disk, the right word for what you're writing is always right at your fingertips.

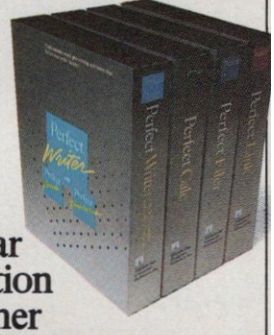


6 Split-screen windows that help keep your thoughts organized—while you write.

You can use one window to jot down notes, key points or an outline—as you develop your text in the other window.

7 Automatic formatting to make your writing look even better on paper.

Perfect Writer appearance features work with most popular printers. So it's easy for your document to look like a masterpiece.



8 Modular integration with other Perfect™ Software.

Perfect Writer software is part of an integrated family. There's also Perfect Calc™ spreadsheet. Perfect Filer™ information management. And Perfect Link™ telecommunications software. Each program uses common commands. So they work together easily—to help you work better.

Four Screen-Imaging Systems

TURN YOUR SCREENS INTO SLIDES

Have you ever tried to photograph the screen display of your Apple's monitor?

Unless your photography skills are well above average, your pictures were probably out of focus, distorted by the curve of the screen, off-color, inconsistent, or otherwise unsatisfactory. You most likely had the wrong lens, the wrong lighting, the wrong exposure, or the wrong film. You waited three days for the film to be processed, and the results were a far cry from the bright, sharp colors you'd had on the screen.

Finally, you probably either turned the job over to a professional photographer or forgot all about it.

If this experience sounds familiar, you can cheer up now because at least four screen-imaging systems are currently on the market, offering solutions that are simple, consistent, cost-effective—and even artful.

Why Slides At All?

A variety of reasons exists for needing to make photographic reproductions—either prints or slides—of the screen display of your Apple's monitor. For some professionals, preparing transparencies for a projection system is a job. For others, it is a hobby or an art.

You will quickly discover the value of a slide show if you have to speak to a group of people. Visual aids can hold the audience's attention through the dreariest presentation and can transform a good speech into a great one.

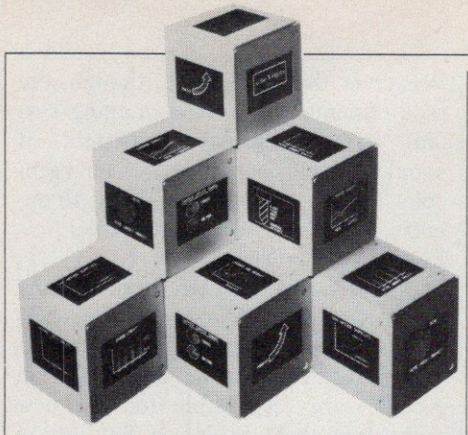
Slide shows are useful both for business and for educational and cultural applications. Computer artists find them to be an effective way to record the work they produce on the screen. Whatever the application, though, the requirements of a screen-imaging system are reasonably consistent—it should be self-contained, deliver high-color fidelity, be simple and fast to operate, and it should be affordable.

Fundamentally Yours

The systems this article covers exist as the result of advances in film technology. The two giants of the photography industry—Polaroid and Eastman Kodak—are responsible for the new technology that allows you instantly to produce computer graphics on slides or prints.

Let's start with the Palette Computer Image Recorder, from Polaroid Corporation, Cambridge, Massachusetts. At a list price of $1799, it should be complete, powerful, versatile, and simple—and indeed it is. The size of a bread box, the Palette consists of a heavy metal case that contains a 4-inch, high-resolution, white-on-black cathode-ray tube.

The Palette's design enables it to convert your Apple's video output into



Visual aids can hold the audience's attention through the dreariest presentation and can turn a good speech into a great one.

hi-res images that can be "colored" according to your own preference. In addition, the system includes a program diskette, a video cable, an RS-232C cable, a power cord, a 35mm auto-wind Minolta XG-A camera body with adapter and control cable, a Polaroid 35mm autoprocessor, and a slide mounter.

The system requires an Apple II, II Plus, or IIe, with at least 64K of RAM, and an Apple Super Serial Card with DIP switches properly set. You need at least one disk drive. Start by attaching your Apple's video-out cable to the Palette's video-in port and attach a second video cable from the Palette to your monitor. Thus, you "loop" your video signal from the CPU, through the Palette, to your monitor. The Super Serial Card provides the necessary RS-232C data-transmission signal and is connected with a cable to the back of the Palette. The Palette is a software-driven device, with a menu-driven command sequence offering coloring options.

The manual makes setting the Super Serial Card for use with the Palette an easy job.

The Palette also comes with a holder/adapter for Polaroid Type 669 film, for exposing instant color prints. A coupon inside the package is redeemable for free packs of Polaroid's color-slide film (Polachrome 35mm) or the company's color-print film (Type 669). Alternately, you may prefer Ektachrome ASA 64, Agfachrome ASA 100, or Fujichrome ASA 100.

Once the equipment is set up and warmed up, boot the software and configure your system—i.e., identify the location of the serial card and set the voltage control. Next, follow the tutorial to make exposures of the color sets on the diskette. Using instant print film allows you to see your results directly after shooting.

Through the use of filters and precisely timed exposures, it is possible to produce images that display up to eight colors from a selection of more than 72 available colors. You can eliminate the familiar problems with Apple color—notably green and violet—by selecting a color set that changes them to white. Furthermore, a Fill mode enhances the detail available on Apple's 280 × 192-pixel resolution—and, if that enhancement is not enough, you can change the background color from black to another color.

In order to manipulate the coloring of a graphics image, you must have the image available on disk and stored as a binary file. Some programs store graphic data this way, and the Palette manual mentions several that offer this essential feature—Apple Business Graphics, Apple Graphics Tablet, Apple Plot, Executive Briefing System, Trendspotter, and VisiPlot.

Polaroid reports that no one has yet written device drivers for the Palette in an Apple mode. Until such drivers are available, you're restricted to coloring graphics that can be stored as binary files.

With a Crank, Click, and Turn

The Polachrome film processor for producing "instant" slides is a slick little gadget; even a writer can understand it. After exposing a roll of film (either 12 or 36 exposures), you rewind it into the film can (being careful not to roll it *entirely* into the can), pop it out of the camera, and drop it into the autoprocessor. With a crank, click, and a turn—followed a few seconds later by another click and a crank—the fully developed film is ready to trim and mount within minutes.

Mounting your slides is a matter of mounting the processed film into a holder, inserting a 2 × 2-inch slide mount, advancing the film into the mount, and trimming it off. The colors are clear, bright, faithful, and sharp.

Screenshooter, a camera-and-hood

The Palette Computer Image Recorder, from Polaroid Corporation, can convert your Apple's video output into hi-res images that can be 'colored' as you like.

THE CBS SOFTWARE FAMILY

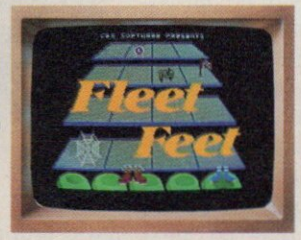
Teams with Excitement.

Your family can be a CBS Software Family, too.

All you need to spend more time together—and have more fun when you do—is CBS Software. No other software company can turn your family's computer into a center of family fun.

When you're a CBS Software Family, you'll love running into *Fleet Feet*,™ * the high-stepping game where you slip into someone else's crazy shoes, and race to the finish.

Then, quick!—think of a game where memory, word association, and mental agility add up to an exciting challenge. No doubt you'd think of *Quink*,™ new for the CBS Software Family. It tests your knowledge of fun-filled facts, so the quickest thinker in your family will be the best *Quink* thinker.



Next, team up for the challenge of *Pathwords*,™ or *Webster: The Word Game*.™ *Webster* starts with key letters deleted from a word, then you race against the clock to pinpoint them before the word vanishes from view. *Pathwords* leads you on a search for connections between letters on a multi-character grid, letting you form words every which way you can.

Then light up your lives with *Light-waves*,™ the program that encourages problem-solving as you use logic to find your way through a fantastic light system, and guide the mysterious Light-Riders to the Source.

To tell you about all the programs we've created for the CBS Software Family, we'd have to put an ad on every page of this magazine.

They said no. And so, undaunted, we put ads on the next few pages instead.

See you soon.

CBS Software programs are available for Apple® II + /IIe/IIc/Macintosh,™ Atari® Commodore 64™ IBM® PC and PCjr. See your retailer for details

device manufactured by NPC (Newton Plastics Company), of Newton Falls, Massachusetts, uses the same film-processing technology described above. For just $169, you can buy this kit and have the means of shooting accurate, consistent pictures directly from your monitor screen.

The kit consists of a molded plastic, cone-shaped hood; built-in relay lens; a Polaroid One-Step camera; and a 35-mm camera mount. There are no hardware requirements, other than your computer and a monitor. Setting up is simple—you load your camera, fasten it to the hood, hold the hood up against your monitor screen, and shoot.

One advantage to the Screenshooter system is that it works with any software. One limitation is that no enhancements are possible. Monochrome monitors produce monochrome pictures; ditto for color, including all the beauty and/or imperfections.

Screenshooter is available with a choice of hood sizes to fit various monitors, including 14-inch, 12-inch, and 9-inch—this last one dubbed the Mac Shooter. A single-lens-reflex camera is recommended, since viewing through the camera lens allows users to see the exact image exposed on the film. You use your camera's built-in metering system to set the correct exposure. Using a zoom lens allows you to frame your image perfectly.

The DATACAM from Photographic Sciences Corporation is another hand-held camera/hood unit for photographing computer screens. The DATACAM is available in two models, the DATACAM I and the DATACAM 35, which cost $545 and $875, respectively. The DATACAM I produces 3 × 4-inch color photographs and uses Koda-

matic Trimprint instant color film. The DATACAM 35 produces 35mm color slides from Polachrome 35mm transparency film, which you can use with Polaroid's AutoProcessor to develop the slides on the spot.

Load, Aim, and Shoot

Similar to the approach of the Screenshooter is that of the Instagraphic CRT Slide Imager, from Eastman Kodak. This kit is based on Kodak's new, high-quality, color-slide film, which can be processed, trimmed, and mounted for use with 2 × 2-inch 35-mm slide projectors within 15 minutes.

The basic unit, priced at $339, includes a CRT cone, an Instagraphic camera back (for use with either slide or print film), a 35mm camera bracket, a filter holder, and a carrying strap. You must purchase an adapter for the basic cone to fit your particular monitor—choose from 9-, 12-, 13-, and 19-inch sizes, at from $40 to $50 each.

As with the Screenshooter, this system automatically positions the camera on the display screen—an advantage that eliminates the need for a tripod and allows you to shoot your picture in natural lighting.

With the Kodak product, you have the choice of using the 35mm camera mount to expose a normal roll of slide film, or using the special camera back and Instagraphic slide (or print) film. This process offers the unique benefit of exposing and developing color transparencies one shot at a time. By exposing your pictures individually, you eliminate the need to expose a whole roll at a time. A pack of ten pictures costs just $12.95—not bad, as it includes the instant processing.

Making instant slides with Kodak's system could hardly be easier. Kodak's advantage is that you do not handle an entire roll of film, but only individual pictures. Each slide is a separate picture unit that begins processing itself when ejected from the camera back. An instant slide is ready for peeling within 8–15 minutes; an instant color print is ready in about an hour.

Kodak's Slide Mounter—priced at $74.99—is significantly more expensive than the corresponding accessory device from Polaroid. Since it mounts each frame individually, however, rather than from a roll—as Polaroid does—the process may be just a little more effortless and goof-proof.

Photo Finish

The NPC Screenshooter (with its Polaroid film technology) and the Kodak Slide Imager system are similar only in their outward appearance. A typical exposure for making a transparency with the NPC device is 1–2 seconds; the same shot on Kodak's hardware takes 6–12 seconds. There's a good reason for this difference.

The Screenshooter delivers faithful color reproduction without requiring use of a filter. A typical exposure might be at an aperture setting of 5.6, with a

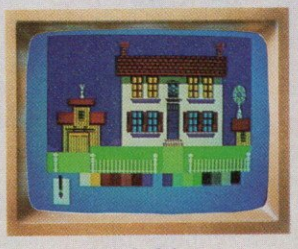
THE CBS SOFTWARE FAMILY

Dreams of Adventure.

Dream up a safari. Redesign your country house. Shuttle from Mercury to Venus.

Sound difficult? Not if you're a CBS Software Family.

With CBS Software, your family can dream up some fun with *Adventure Master*,™ the game where you create and play out your own exotic adventures. Save a galaxy, search for sunken treasure or go on that safari you've been saving for. *Adventure Master* takes you there.



If you'd rather stay closer to home, how about *Dream House*,™ where you own a *real* estate to design and build from the inside out. Even the landscaping is guaranteed to be more fun than the real thing.

If that's not the perfect fit for your family, match up with *Match-Wits*.™ Gather the whole family around to concentrate on matching pairs (like a movie star to a starring role) and deciphering a puzzling picture. It's even programmable, so you can enter in all sorts of pairs that have special meaning to your family.

It's no mystery CBS Software offers programs to enrich the time the whole family spends together.

But instead of telling you about other programs, we'd rather keep you in suspense...

Alright, turn the page.

With Eastman Kodak's Instagraphic CRT Slide Imager, you can expose and develop color transparencies one shot at a time, rather than handling an entire roll of film.

shutter speed of 1.5 seconds, if you're using Polachrome film with a speed of ASA 40. Kodak's Instagraphic film, on the other hand, has a film speed of ASA 80, and the system requires the use of a built-in Wratten-85 (orange) filter. The filter adds about one f-stop to the exposure and reduces the effective ASA of the film, creating the need for a longer exposure. A longer exposure can introduce the possibility of "camera shake" in your results, producing a picture that is out of focus.

Certain procedures can help you produce better pictures when shooting directly from a CRT. First, make sure that you set the monitor to medium or dim brightness, as images have a tendency to "bloom" during a longer exposure. If you're shooting from a Macintosh screen, with its black-and-white display, you can achieve excellent results with Polaroid's high-contrast black-and-white transparency film. Kodak has no black-and-white Instagraphic film, but both Polaroid and Kodak recommend using a blue filter with color film to achieve black letters on a pale-blue background.

The NPC system has an advantage over Kodak's, in that its 35mm camera mount is adjustable, which allows you to mount virtually any single-lens-reflex camera with good results. Kodak's mount uses angle brackets and is not as accommodating. Another difference between the two "hoods" is the absence of built-in optics in the Kodak system. Because the NPC Screenshooter contains a built-in lens, it can be used with many cameras. Kodak's system relies on the optics contained in its dedicated, permanently modified Colorburst 50 Instant Camera.

What about results? Quite frankly, the results were excellent with all four film systems. I give Kodak the edge in convenience for allowing us to expose, process, and mount one piece of film at a time—even though the longer exposure times can be a bit troublesome. Polaroid's Palette certainly has the edge in artfulness. In economy and versatility, NPC's Screenshooter excels.

The real winners in the race for excellence in the instant-photo marketplace are the consumers, who can now find high-quality photographic tools for preparing visual aids.

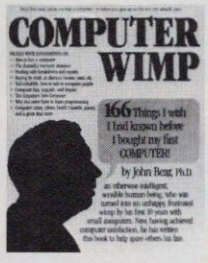
Building your apple bookshelf

The core of an Apple library for beginners and advanced users

Anyone who doubts the popularity of home computers has but to look at the plethora of related literature that has sprung up over the past four or five years. Some of the best computer books are still being published by small, independent houses, but their marketing is no longer relegated to computer stores. Predictably, the publishing giants have discovered the lucrative market for these books, so not only do most bookstores now have a special section for this new body of literature, but many also have subsections dedicated to particular computer models, languages, operating systems, and even specific programs.

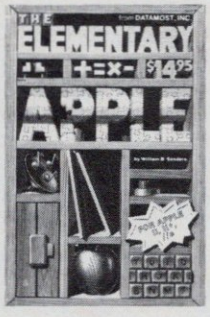


If you have just recently acquired your first computer, you probably already have a small collection of hardware and software manuals, but brace yourself—it's only a beginning.

Manuals are important, but they alone are not going to unravel all the mysteries of your computer. In fact, some manuals are more confusing than enlightening, which is why the market for outside books on specific programs and hardware is sizable.

Unlike most other machines we buy, computers are designed for expansion—not all computers, of course, but most of them, and certainly the Apple II, II Plus, and IIe. I bought a II Plus in 1979 and, thanks to added peripherals and memory, that *same* machine is today infinitely more sophisticated and functional than it was five years ago. It didn't just grow better by itself, though. I had to learn how to improve it and, mainly, how to take advantage of what was already there. Attending users' group meetings and reading magazines is educational, but a good book is often the best source of information.

Choosing the right books for your needs can be as confusing a task as selecting the computer itself. So, assuming that you have already done the latter and that it is an Apple II, II Plus, or IIe, we have assembled two modest lists of suggested books, some of which have been around for a while, that you can use as a basis of your Apple library. Two lists, because we realize that some books are too technical for beginners and other books are too basic for advanced users. Of course, some computer books belong on everyone's shelf, so you may want to combine the two lists into one comprehensive library.



Starting Out

Computer Wimp by John Bear is not Apple-specific, but it has to be one of the most entertaining and informative books ever contributed to computer literature. It is designed to aid people who have not yet bought a machine, but its usefulness will not end when your Apple is installed. Its 286 pages are crammed with wry humor and hilarious illustrations that are guaranteed to keep on pleasing even the most advanced computerist. If Bear leaves unanswered any questions that a new computer user might have, I have not found them—he even deals with the subject of becoming a former computer user, a sort of detoxification process.

The Elementary Apple and the *Apple II User's Guide* offer two different approaches to acquainting users with the fundamentals of Apple II computing. Both books show you how to set up and plug in equipment. The former goes on to teach a rudimentary course in BASIC programming, and the latter—a 1983 revised and updated edition of an earlier classic—also delves into BASIC's relationship with machine language and, in general, digs deeper. There is unavoidable repetition here, but these books can easily coexist on the same shelf, and at least one of them belongs there.

They named it *Kids and the Apple*, but this 222-page spiral-bound book is just as much for adults whose Apple has taken them into a second childhood. Written in a simple step-by-step style, it is a basic BASIC tutorial containing lessons, tests, and assignments designed as much to amuse as they are to instruct. *Kids and the Apple* will have you entering and saving games until you are ready to create your own.

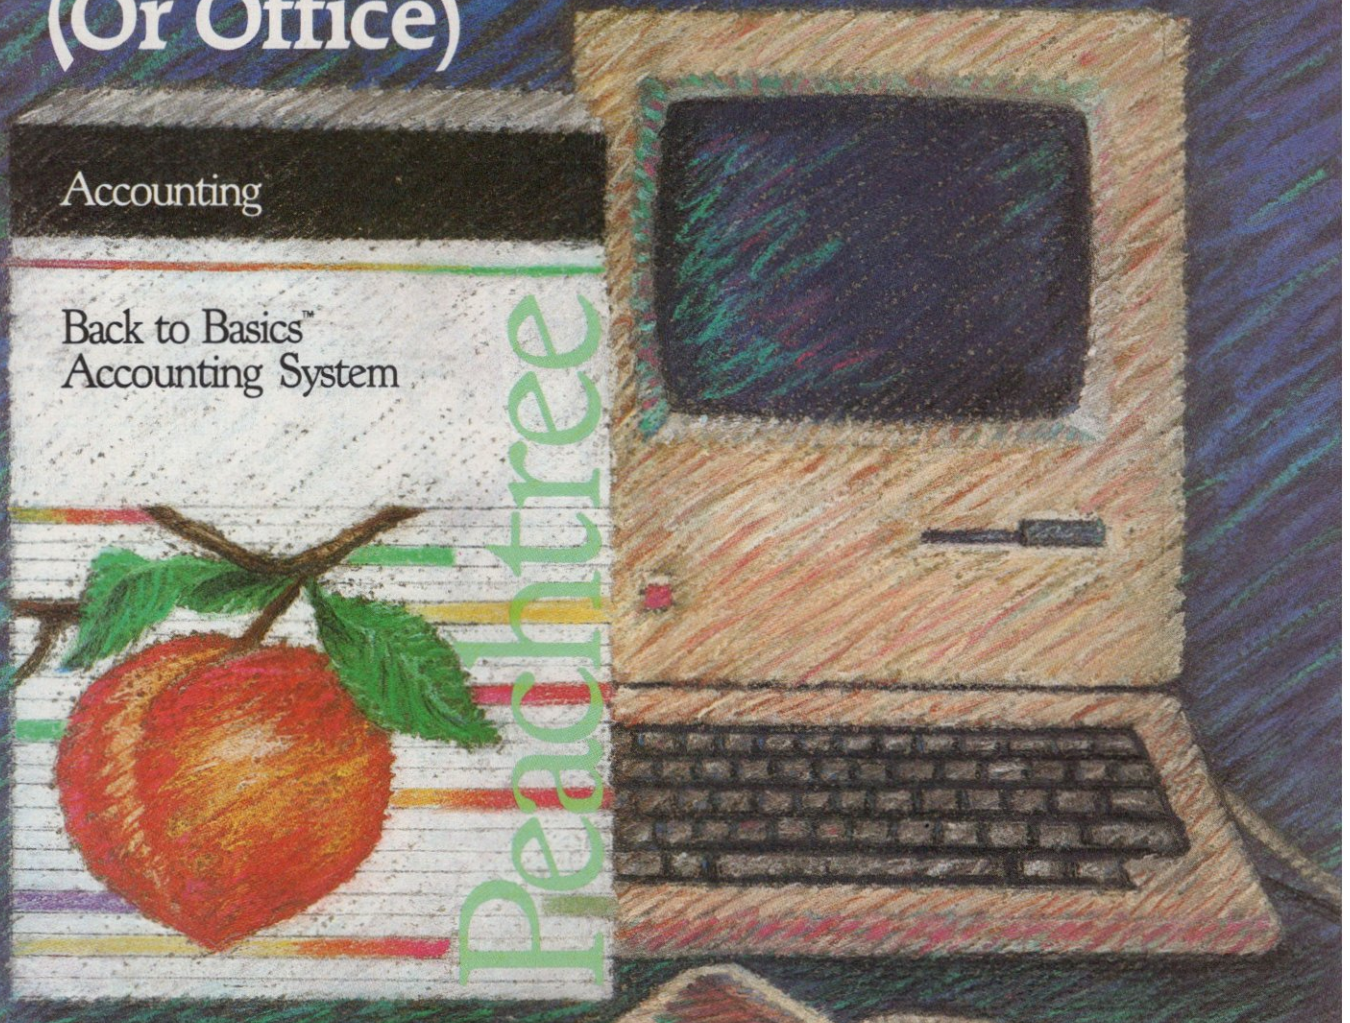
Introducing Accounting For Those With A Mouse In The House. (Or Office)



Back to Basics Accounting System by Peachtree Software® is now available for the Macintosh.™ It's named Back to Basics because it is an uncomplicated, easy-to-learn accounting system for small businesses.

You don't need any accounting experience and barely need any computing experience. The straightforward manual teaches both accounting and computing at the same time.

But make no mistake. This is a full-featured series of interactive products including General Ledger, Accounts Payable and Accounts Receivable.

The first business accounting system for the Macintosh, Back to Basics has been enjoyed by owners of Apple® II+, IIe and IIc all along. In fact, you've probably seen it featured in Apple Macintosh advertisements.

Uncomplicated—easy-to-learn—yet full featured. That's Back to Basics.

Getting Serious

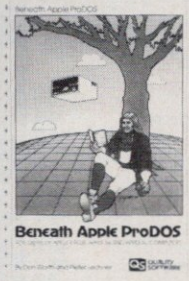
If *Kids and the Apple* gives you a taste for creating games and graphics programs, Jeffrey Stanton's *Apple Graphics and Arcade Game Design* is a book you may want to add to your Apple shelf. But don't consider this book if you are just going to dabble at it, for although it does not require that you have prior experience in assembly-language programming, it expects you to learn it.

It also necessitates the use of a decent assembler program. To facilitate the learning experience, the publisher offers, on disk, a bit-mapping utility and several code listings from the book for a nominal $10 each, plus $1.50 postage.

Apropos assembly language, we recommend to serious programmers a rather weighty volume entitled *6502 Assembly Language Programming* by Lance A. Leventhal. Most of us will never dig this deeply, but if you really want to explore the interior of your 6502 processor, this book is the way to go. Be forewarned, however, that you

had better enter with considerable prior knowledge of computers and how they work.

While you can run your Apple II without having any knowledge of assembly language or, for that matter, BASIC, you must know something about DOS (disk-operating system) commands, if for no other reason than to boot, format, and copy diskettes. Apple Computer's own manuals go well beyond teaching what beginners need to know, but two books from Quality Software, *Beneath Apple DOS* and *Beneath Apple ProDOS*, go even further.



OK, so you've mastered assembly language, written the Great American Program, and are getting ready to put it on the market—what to do now? Take a look at *Legal Care for Your Software*, which is written by an attorney, Daniel Remer. You won't need a law degree to understand it. This book is a must for software developers and publishers who wish to protect their products without having to go into debt for legal expenses. It tells you all you need to know about national and international software laws, patent requirements, trademark registration, copyrights, and the like. It also contains sample contracts and agreements to cover just about every facet of software development and publishing.

When it comes to business applications, many Apple II users find themselves all but abandoning DOS in favor of CP/M, a more universal operating system, for which some outstanding software exists. Apple II-series computers do not come equipped with CP/M, but it is easy to add in the form of a card that fits inside the machine. These cards—and a variety of them is now available—usually come with documentation explaining the operating system and how it works.

Although many CP/M users are content to boot up WordStar, Super-

Improve Investment Decision-Making With STOCKPAK II-

Standard & Poor's superior fundamental analysis software

Ten compelling reasons why *you* should be using Stockpak II right now.

1. During the past 125 years, Standard & Poor's has built a ***tradition of excellence*** in delivering valuable investment information to professional and individual investors alike. And, S&P has been providing software and data to investors with personal computers since 1980.

2. Stockpak II is ***effective during up, down, and stable market periods.*** The monthly update diskettes provide the latest information on each of the companies in the database. Wise investors look for undervalued stocks during bull market cycles, and over-valued stocks during bear market cycles. Regular monthly tracking of the stocks in your portfolio is important during all market cycles.

3. ***Stockpak II can be used effectively by investors with different investment objectives.*** For example, cautious investors might want to screen for large companies with stable earnings, high yields and low PE's. Aggressive investors might want only small companies with outstanding growth in sales and earnings. You might want companies in certain industries, or only those trading below their book value, or selling at a fraction of their high price, and so on.

4. Stockpak II covers more companies. It contains dozens of vital facts on more than 4,500 companies — ***nearly three times as many companies as in other software systems.***

5. Stockpak II contains more information. We provide about 75 important information items on each company (facts on earnings, dividends, sales, stock price behavior, balance sheet data, etc.) Users can create about 25 more items on the disk. By using back-up diskettes, unlimited numbers of items are available.

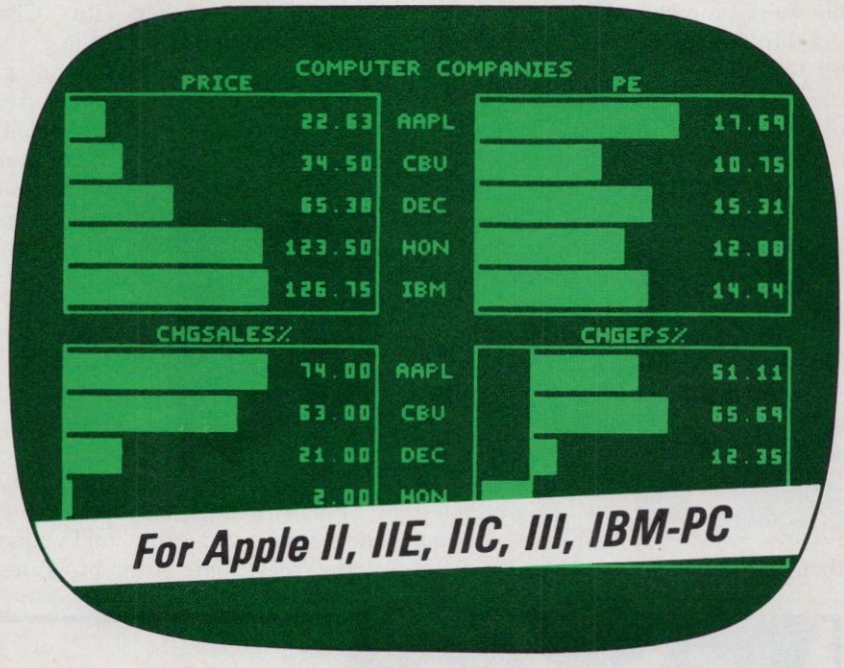
6. Stockpack II lets you create your own information items. You can experiment with different analytical approaches by creating and screening your own data items. ***No other system has this feature.***

7. Stockpak II uses graphs to highlight a company's sales and earnings trends and to compare the performance of one company with another. ***No other system has this feature.***

8. Stockpak II is extremely ***easy to learn and use.*** This is due to extensive "on-screen" help, and to our User Guide which is clear, concise, and illustrated.

9. Users have ***excellent protection from loss or damage*** to any of their diskettes because unlimited backup copies can be made of all Stockpak II diskettes.

10. Stockpak II comes with our ***unique money-back guarantee.*** You may cancel the service within 60 days and get a refund on your subscription fee.



Still not convinced? Take our special one-month trial.

If you're hardnosed about your software purchases and want to judge Stockpak II's superiority for yourself, send for a one-month trial of the System. It's just $30.00 . . . and it will show you why and how our software — more than any other — can help you make better investment decisions.

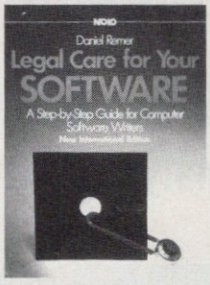
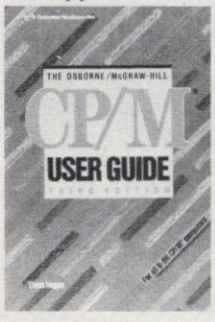
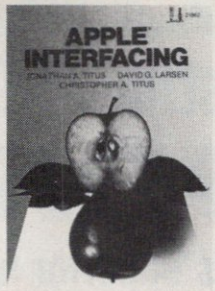
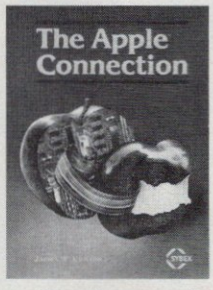
Calc, Multiplan, or dBASE II and let it go at that, others tackle CP/M with the determination of a child on an Easter egg hunt. For them there is Thom Hogan's *CP/M User Guide*. It is available in various editions — including one specifically designed for Microsoft's Softcard— but we recommend the third edition, which is geared to 8-bit CP/M computers and covers both the CP/M 80 (2.2) and the CP/M Plus (3.0) versions of the operating system.



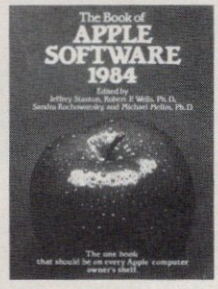
Not all Apple tinkering involves software. Most of us take advantage of our Apple's hardware-expansibility, but often we do so in an unadventurous way. We simply purchase peripherals such as printers, disk drives, and modems, and plug them in. Even store-bought add-ons can give you a devilish time, though, when you try to make them work with the software and hardware you already have. Sometimes the remedy is not as easy as pushing a few DIP switches. You may have the wrong cable (looks can be deceiving), or you may need a software patch. *Apple Interfacing* by Jonathan Titus, Christopher Titus, and David Larsen can teach you to pinpoint and solve such minor problems, but it is also for creative types who want to use their Apple II-series computer for such tasks as controlling other electronic or electromechanical devices or for monitoring external events. If you want your Apple to control home appliances or a security system, take a look at James W. Coffron's *The Apple Connection*.







Finally, your Apple is only as good as the software you feed it, and we assume that at least some of the programs you use will be commercial application software. That being the case, you will find *The Book of Apple Software* series to be a handy guide. With some illustrations of screen displays, these books contain reviews and assessments of every kind of Apple software (and a modicum of hardware) imaginable; they are published annually, and I have used them since 1980. Just as some software lingers on store shelves year after year, so does coverage of long-lived programs in these guides. Even though you'll notice some repetition from year to year, the books are still worth the $19.95 price. I don't agree with all the evaluations in the series, and, I suspect, neither will you. The reviewers (70 of them worked on the 1984 edition) are pretty thorough, though, and the book's format is such that most questions are answered.



Considering the number of books dedicated to the Apple II-series computers, our suggested libraries are relatively small, but, like the computers, they are eminently expansible. +

BACKUP YOUR DISKS

NOW AVAILABLE AT YOUR LOCAL COMPUTER STORE

ESSENTIAL DATA DUPLICATOR III™

EDD runs on Apple II, II plus, IIe, IIc and Apple III (in emulation mode) using one or two disk drives.

EDD allows you to easily and quickly make back up copies of your "uncopyable" Apple disks. ■ Since EDD has been preset to copy the widest range of copy-protections possible, you just simply boot up EDD, put the disk you want to copy in one disk drive and a blank disk in the other (EDD will work using one drive also) and in about 2 ½ minutes a copy is made. ■ Unlike the "copy-cards" which only copy "single load" programs, EDD copies the entire disk. This would be similar to hooking up two cassette recorders, playing from one, and recording to the other. ■ We have even included an option so you can check the speed of your disk drives because drive speeds running fast or slow can damage disks and cause other problems. ■ We publish EDD program lists (information about copy-protected disks) every couple of months, which EDD owners can receive. The current list is included with the purchase of EDD. ■ The bottom line is this; if EDD can't copy it, chances are nothing will.

$79.95 Ask for EDD at your local computer store, or, *to order direct;* send **$79.95** plus $2 shipping ($5 foreign). Mastercard/Visa accepted. *Prepayment required.*

***Warning:** EDD is sold for the sole purpose of making archival copies ONLY.*

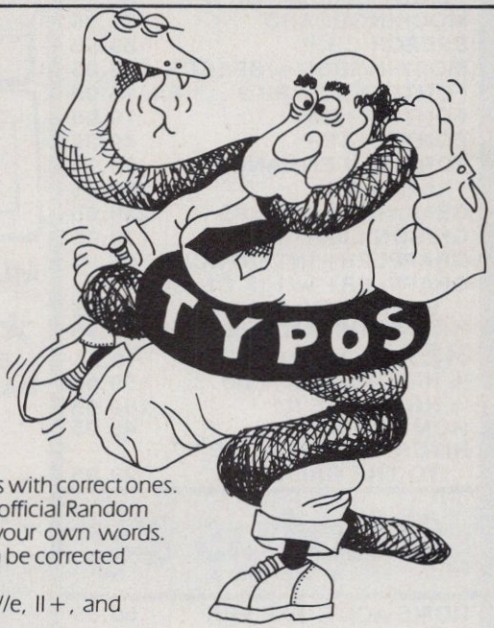
It takes only One Spelling Mistake to blow your image



No matter how much work you've put into that report, no matter how accurate your references and sound your conclusions, a single spelling mistake can destroy its credibility.

HOW CAN YOU GUARD AGAINST THIS? Simply check your paper with Sensible Speller™, the software program that is a virtual electronic dictionary. With tireless, efficient detachment, it will catch mistakes you would not notice. It will in fact display misspelled words in context, suggest the correct spelling, and allow immediate replacement of misspelled words with correct ones.

WHAT IS THE SIZE OF SENSIBLE SPELLER'S VOCABULARY? All 80,000 words of the official Random House Dictionary. And there's enough room left on disk to add thousands of your own words.

HOW LONG DOES IT TAKE TO USE SENSIBLE SPELLER? A ten-page document can be corrected in one or two minutes.

ON WHAT COMPUTERS CAN YOU RUN SENSIBLE SPELLER? On all Apple //c, //e, II+, and Apple-compatible computers.

WHERE MAY SENSIBLE SPELLER BE PURCHASED? It is available at your dealer for $125 in either the "IV" or ProDOS version.* It may also be ordered direct, enclosing $1.25 for shipping. Visa/MasterCard/Check/COD welcome.

Sensible Speller ™ *is a product of*

Sensible Software, Inc.® 210 S. Woodward, Suite 229, Birmingham, MI 48011 (313) 258-5566

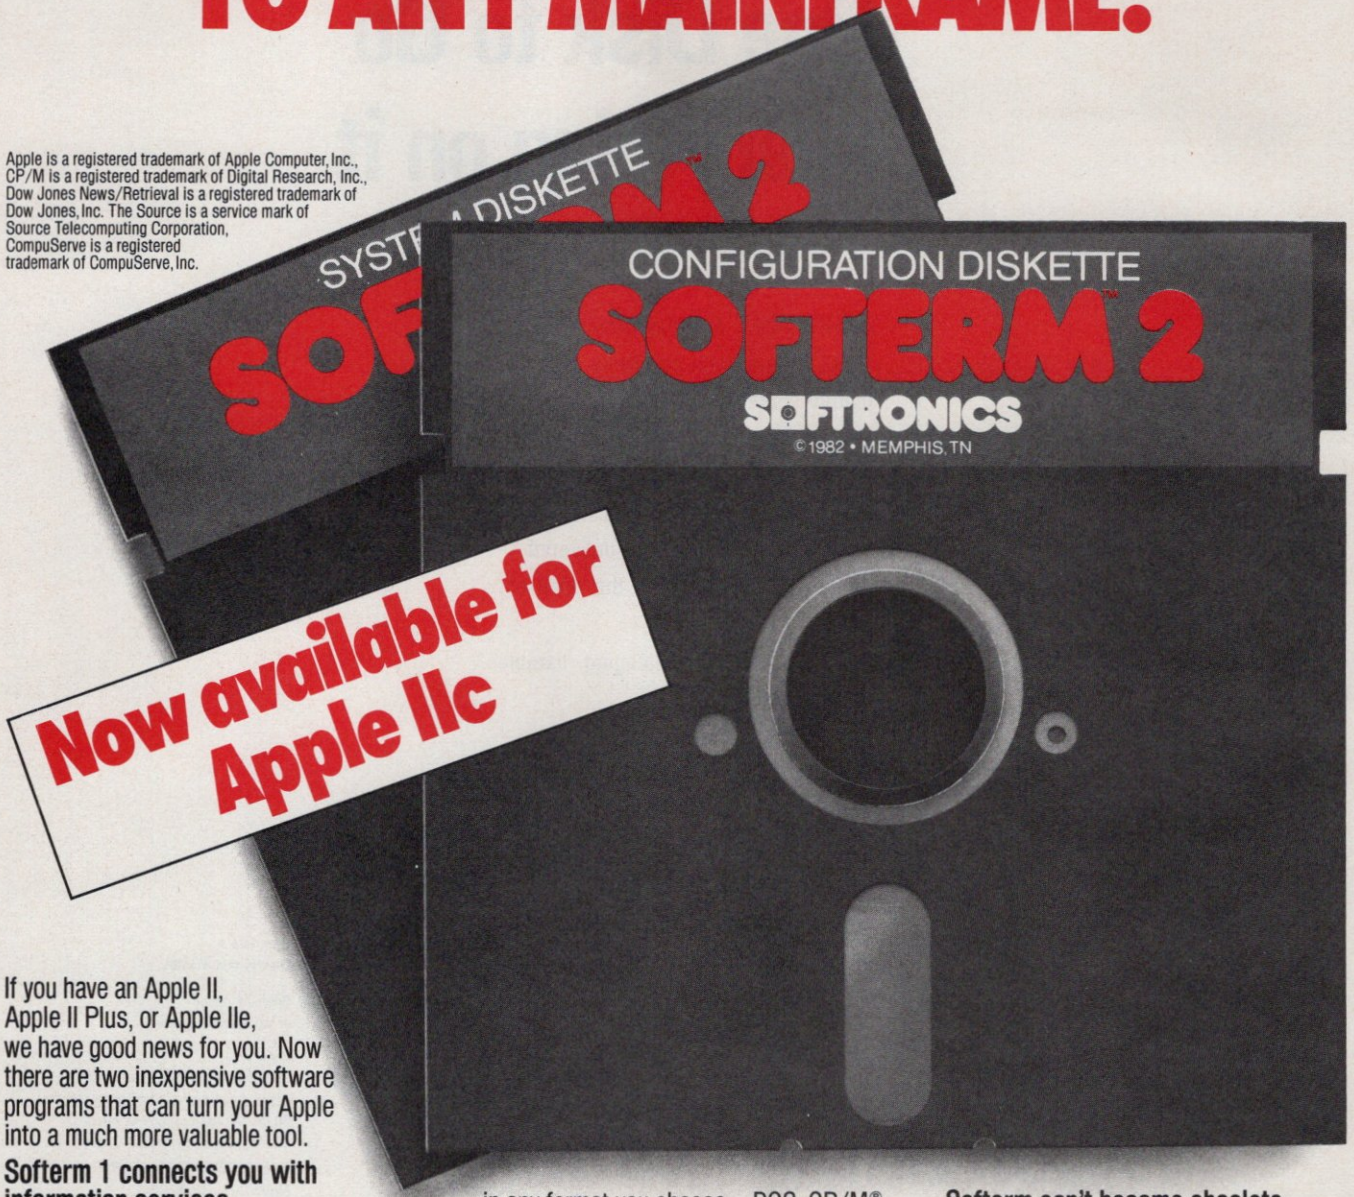
The Source is a service mark of Source Telecomputing Corporation, CompuServe is a registered trademark of CompuServe, Inc.



If you have an Apple II, Apple II Plus, or Apple IIe, we have good news for you. Now there are two inexpensive software programs that can turn your Apple into a much more valuable tool.

Softerm 1 connects you with information services.
Softerm 1 lets you retrieve information from services such as *The Source,*℠ *CompuServe*®, and *Dow Jones News/Retrieval*®. Plus, gives you the ability to access bulletin boards and send or receive electronic mail. Other features include user-defined keyboard macros, built-in phone book for automatic dialing, terminal mode line capture simultaneously to print or disk, copy screen to print or disk, and terminal status display.

Softerm 2 connects you with your company's computer.
This expanded version of Softerm lets you gain access to the information stored in your company's main computer from your home or office. With either version of Softerm, you can down load information into your Apple and capture it on your own disk in any format you choose—DOS, CP/M®, or Pascal. Also included with Softerm is a source program for your host computer to ensure compatibility with Softerm's file transfer capabilities.

Makes your Apple work exactly like any major terminal.
Softerm 2 provides complete emulation of these terminals: ADDS Regent 20, 25, 40, 60; ADDS Viewpoint; Data General D200; Datapoint 3601; DEC VT102, VT52; Hazeltine 1400, 1410, 1500, 1520; Hewlett-Packard 2622A; Honeywell VIP7205; VIP7801, VIP7803; IBM 3101 Model 10 and 20; Lear Siegler ADM-3A, ADM-5 and TeleVideo 910, 925, 950. And the list is growing all the time. We'll send you a User's Guide, handy reference card, and a telephone number to call if you need more assistance.

Softerm can't become obsolete.
We constantly improve Softerm. And we make those improvements available to you 24 hours a day, 7 days a week. To update your program, just dial our computer and transfer the improvements to your disk.

A READER'S GUIDE TO APPLE DOCUMENTATION

Picking Apple MANUALS

Once upon a time, when you bought products from Apple Computer, Inc., Apple gave you a lot of manuals—everything it had, from schematics of the circuit board, to ROM listings, to specifications for the game port. Few people needed all of that detail, but it was nice to know it was there.

Fewer manuals come with the current crop of Apples, and those that do are geared to get you started, but not much more. Some of us can get by with this amount of information, but others need to have more. To help you decide which manuals you need to buy, I have prepared the following annotated list.

Applesoft

Most Apple owners eventually want to delve into programming, even though they bought their computer originally to do word-processing or spreadsheeting tasks. Learning a bit of programming gives some insight into how the computer works and may enable users to accomplish tasks that they can't do with commercial software. Apple devotes its largest collection of manuals to programming in Applesoft, Apple's version of BASIC.

Applesoft Tutorial is written for the beginner. The tutorial develops a series of small programs that illustrate the most important features of Applesoft. It lacks flash or glamour, but in conveying the essentials of Applesoft, the *Applesoft Tutorial* is comparable to—and probably better than—most of the introductory books from other publishers. If your goal is to get the flavor of what programming is like, you need go no further.

Applesoft Programmer's Reference Manual is a two-volume set that covers Applesoft from A to Z. It is indispensable for users who plan to write programs in Applesoft.

The first volume approaches Applesoft from a functional standpoint: How do you get information into the computer? How do you tell the computer to act on the information? How do you display the results? and so on. An excellent chapter describes how to attack specific programming problems.

The second volume contains the appendixes to volume 1, including an alphabetical listing of all Applesoft commands; a list of ASCII values; a list of error messages; lists of PEEK, POKE, and CALL locations; and so on. (These Applesoft commands allow you to read, change, and use machine language from BASIC.) After you master the concepts in volume 1, you'll find the second volume to be your most referenced book.

The Applesoft manuals were recently revised to cover both the Apple IIe and IIc. Most of the information in them, however, is useful to Apple II or II Plus owners. A third Applesoft package, the *Applesoft Programmer's Kit*,

is also available. It includes a collection of useful utilities for Applesoft programmers, which I recommend highly.

DOS and ProDOS

The *Dos 3.3 User's Manual* and *ProDOS User's Manual* are the instruction manuals for the DOS 3.3 User's Disk and the ProDOS User's Disk. Apple provides a disk of utility programs with its disk drives so that beginners can use the Apple disk-operating system (DOS) without learning difficult commands.

Apple's manuals have always been respected in the industry for their style and thoroughness.

If you have an older Apple Disk II, you received with it a DOS 3.3 System Master, which is equivalent to the DOS 3.3 User's Disk. Currently, Apple Disk II owners receive the ProDOS User's Disk and Manual with their systems. Until DOS 3.3 fades from sight, every Apple owner will probably want both of these disk/manual sets. Apple IIc owners can use these utilities and the information in the books, but virtually all functions provided here are also included on the IIc System Utilities disk and manual.

The *DOS Programmng Manual* and *BASIC Programming with ProDOS* are companion volumes that explain in detail how to use these two Apple operating systems. The manuals are similar, and the program examples are equivalent. Even if you don't plan to program in BASIC, these books will supply you with all sorts of essential information. For example, the manual that comes with the Apple IIc does not contain any information on how to catalog a disk. *BASIC Programming with ProDOS* describes the difference between CATALOG and CAT commands and explains what the information presented by each command means. If you are a new Apple owner using ProDOS software, you should have *BASIC Programming with ProDOS* in your library. If you are a BASIC programmer, you'll appreciate the utilities that come on the disk with the ProDOS manual. You'll need both books if you are also using DOS 3.3 software or are planning to write BASIC programs to access data created with DOS 3.3 software.

The *ProDOS Technical Reference Manual* is another manual for advanced users. It contains a complete technical description of ProDOS and is specifically intended for programmers who utilize ProDOS from assembly language. The package also includes a disk, the ProDOS Exerciser, that allows users to experiment with ProDOS parameters without writing entire programs.

Miscellaneous Manuals

The manuals that come with most peripherals and interface cards tend to be more technical than what general users need. The AppleMouse II is a case in point. The manual that accompanies the mouse describes the installation and operation of the device, explains the operation of MousePaint, and provides technical information for programmers who want to use the mouse in their programs. You may need only some of this information, but it is all there.

The *80-Column Text Card Manual* and *Extended 80-Column Card Supplement* apply only to the Apple IIe and IIc computers. Apple IIe owners receive the manuals when they purchase an 80-Column Text Card or an Extended 80-Column Card. Apple IIc owners, however, must purchase the manuals separately, since the 80-column card is built into the computer. Programmers working on Apple IIc computers may need the information in these manuals, which, like other Apple technical manuals, contain useful tips and program fragments. Although the manuals are written for assembly-language programmers, Applesoft programmers will find some mysteries cleared up. (For example: Why doesn't my GET work when the 80-column card is active? How can I tab to column 60? and so on.)

The *Reference Manual for the IIe* and *Reference Manual for the IIc* are essential references for users who write assembly-language programs, build hardware add-ons, or crave to know nearly everything about the hardware and the ROM operating system of their computer. The manuals are well written and quite technical, and thus they are most useful to intermediate or advanced programmers.

Rounding Out the Shelf

Four books from other publishers will complete your shelf of Apple documentation. These books contain information that is scattered throughout the Apple manuals or missing from the materials the public can purchase.

The *Apple II User's Guide* by Lon

Poole is a complete reference manual. It organizes for easy use the information from the Applesoft reference and DOS manuals; and for the beginner, this book, along with the *Applesoft Tutorial*, is enough to start programming in Applesoft. The *Apple II User's Guide* does not specifically cover the Apple IIc, but most of the information is applicable to the IIc.

All About Applesoft, edited by Val Golding, contains a multitude of useful routines and the kind of information that only a group of dedicated hackers working overtime could dig up. Their labors, published as articles in *Call-A.P.P.L.E.* magazine, have been put together in an essential book for all serious Applesoft programmers. A disk containing the programs is available to members of A.P.P.L.E.

Beneath Apple DOS by Don Worth and Pieter Lechner completes the information found in the Apple DOS manuals. The book provides very technical information about the disk-operating system. A new volume, *Beneath Apple ProDOS*, follows in the footsteps of the Apple DOS edition, providing technical information for those who want to program under ProDOS.

What's Where in the Apple by William F. Luebbert dissects the Apple computer, logging and identifying the function of every memory location. This book is not very useful to beginners, but becomes invaluable as users gain experience. The current edition contains a lengthy guide to help you use the information, and a supplement that covers the Apple IIe. At this writing, the Apple IIc is not included.

Among veteran Apple owners, the unbundling of documentation and hardware is of some concern. We needed the massive amount of information that came with our systems because we had to write programs to do almost anything. Today, however, new users can rely on commercial software to accomplish most—if not all—tasks. Apple's manuals have always been respected in the industry for their style and thoroughness, and the new manuals continue in this tradition. Moreover, because users can purchase the manuals separately, they need not pay for information they cannot use. +

MOVE OVER, MAC

FONTRIX GIVES YOU MACPAINT DOCUMENTS FROM AN APPLE II

Has the arrival of the Macintosh computer filled you with envy? Have you seen the documents the Mac can make and wished your computer could create them? Would your business or organization benefit from more dynamic bulletins?

If your answer to any of these questions is yes, then read on, and I'll show you how your Apple II Plus, IIe, IIc, or III can tackle a new challenge. The Macintosh has MacWrite and MacPaint; the Apple II and III families have Fontrix.

Fontrix

Fontrix, from Data Transforms, is a high-resolution-graphics utility. It lets you combine text with images to create graphics 16 times larger than those the screen can display and lets you print them out as one full-page graphic. I was using Fontrix with my Apple II Plus to create fliers and newsletters—combining different fonts and pictures—when a macintosh was spelled with a *k* and was something you wore.

Look at figures 1 and 2 on the following pages. Figure 1 is part of a MacPaint document, and figure 2 is a section of the printout of a Fontrix "Graffile." You too can create documents that rival those of the Mac.

Fontrix comes on an unprotected

disk with many utilities, including an excellent font editor and graphics dump. An illustrated, 130-page looseleaf manual contains tutorials, reference sections, and commands on a handy card. The entire manual was created and printed with Fontrix.

The program is menu-oriented and foolproof. Fontrix accepts input from the keyboard and the AppleMouse II,

Some of the things you can create are bar and pie charts, advertisements, and newsletters.

as well as paddles, joysticks, trackballs, and graphics tablets.

The graphics dump works with more than 30 printers and with just about any printer-interface card.

With the font editor, which permits 32 × 32-pixel characters, you can easily create your own fonts or edit the ones provided. For those users who want a variety of impeccably designed typefaces, Data Transforms periodically publishes Fontpaks, which comprise sets (each Fontpak contains ten new fonts) of icons, foreign alphabets, music symbols, and electronics symbols—just about anything you want or need (see samples on pages 58 and 59).

Since this article is a tutorial and not a review, I won't discuss the software in detail. Instead, let's concentrate on the Graphic Writer and Graffiles.

Graffiles

You can use Fontrix to create standard hi-res graphics, or you can create a Graffile—a file consisting of many graphics screens. The Apple hi-res screen is the equivalent of 5 horizontal units × 6 vertical units. A Graffile can constitute up to 80 units horizontally and up to 96 units vertically. You start a Graffile by inputting the size you want it to be. The printer you dump your Graffile to determines its size. An Epson MX-80, for example, prints a Graffile up to three screens wide and four screens long. Once the parameters are set, you are ready to "write" on your graphic.

Graphic Writer's 27 options include drawing and writing with an assortment of brushes and fonts, erasing, inverting, working within windows, and selecting from 32 different background and foreground colors and patterns. At any time, you can go to the menu to load a different font (the master disk contains 11 fonts) or graphic (any graphic, created with any software),

IT'S A WAR!

DAY-BY-DAY

EDITORIAL

At the last meeting of the Board of Directors, it was agreed that nothing short of all out war would have an effect on the computer addict.
Proposed strategies were of such a violent nature that we cannot report them in a family newsletter.
The suggestion was made that we seek government aid. One member thought the Vatican should be consulted. Another member went so far as to volunteer to bomb Cupertino.
At our next meeting we will vote on the bombing.

VOTE at our next meeting

In the town of Lambeth, the Apple dealer reported sales of 130 Apple //e's and 75 Apple //c's. This is bad news to the ACWA since we can, based on previous figures, assume that there will be approximately 40 new Apple widows or widowers, within six months.
ACWA members in Calabash report that they picketed two computer fairs. These members carried signs reading "Apples destroy homes" and "Do your computations include your family?"
Four female members of ACWA reportedly served their husbands toasted diskettes for dinner. We don't advocate this, as all four husbands have filed for divorce.

THE PEACEFUL TOWN OF ZENDA HAS NO ELECTRICITY. PORTABLE COMPUTERS NOW THREATEN DOMESTIC BLISS.

Be alert to tell-tale signs!

Dear Reader:
This is the second issue of our newsletter. We thought you would be interested in the progress of Hubert Meredith, husband of our founder, Milicent. Hubert is now in Portland, Oregon, (data-base-ussa), up to "K". Hubert was fired from his job two months ago when his sick leave ran out. Milicent reports that he has lost 45 pounds.
The purpose of our organization is to help people like Milicent and Hubert, but we cannot do it without your help.
Come to our meetings. Help with our hotline phones. Spread the word that Apple's are a serious threat to all of us.

and then return to your Graffile.

As you work, moving the cursor off the edge of the screen, the screen scrolls one row of units. The information that goes out of view is written to disk, and the new information is read from the disk and appears on the screen (see figure 3). Horizontally, the scroll of one unit is equivalent to one-fifth of the hi-res screen, and vertically it is equivalent to one-sixth of the screen. Depending upon the size of your Graffile, you can scroll and scroll and find you still have more space ahead of you.

Scrolling from screen to screen, it is easy to get lost in the Graffile because there is no way to see the entire page at one time.

To avoid this problem, you can create a master Graffile with nothing on it but marks indicating where each screen ends—horizontally and vertically—as well as half-screen marks. When you start a new Graffile, open a copy of this master. As you move through your file, the marks will pinpoint your position on the entire page.

To create the newsletter illustrated in figure 2, I opened a copy of my master Graffile, which was 18 units (3½ screens) wide and 24 units (4 screens) long. I scrolled to the section of the Graffile where I wanted to place the first picture, went to the menu and selected Load a Graphic. The picture of the tea party, a full-page hi-res graphic created with another program, loaded onto the screen, and I returned to my Graffile. I scrolled around, typing in the newsletter title and the headlines. I created the graphic in the center column using a pictorial font called Leaves. After loading in the last picture, I scrolled from screen to screen, changed fonts, typed in the copy, and added borders and other details. To get the text in columns, I used the Window option.

When the Graffile was complete, I "closed" it, went to the main menu, and selected PRINT GRAPHICS. After choosing a printing option from the many provided, I sat back and watched my Epson print a newsletter. A full-page Graffile takes about five minutes to print.

The variety of fonts and the graphics capabilities of Fontrix allow you to create documents that are even more elaborate than the newsletter in figure 2. You have only to look at some of Data Transforms advertisements, all done with Fontrix, to appreciate the power of this program. Some of the things you can create are posters, certificates, bar and pie charts, letterheads, announcements, résumés, diagrams, greeting cards, needlework designs, advertisements, floor plans, and newsletters.

Working with the Macintosh is easier and faster than working with Fontrix, but, with patience, there is little that can be done with one that can't be done with the other.

We bought our Apple II computers because we thought they could do just about anything any home computer could do—and they can. With Fontrix, we can even tell the Macintosh to move over. ✚

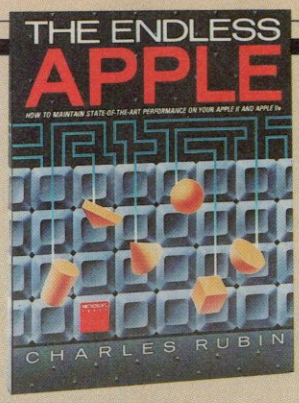
The Endless Apple is a new book from Microsoft Press that tells you how to maintain state-of-the-art performance on your Apple II-series computer. Charlie Rubin, the book's author, is an avid Apple enthusiast who explains how to get more power out of your Apple by taking advantage of new developments in hardware and software. The book covers word processing, spreadsheets, databases, integrated software, communications, games, and more.



This month *A+* will present the first installment of a two-part excerpt from *The Endless Apple* that is taken from chapter 1, "The Beginning," and chapter 3, "Superior Spreadsheets." This part will show you how to get more out of spreadsheets on your Apple, which seems especially fitting, since Apple's initial success was due in large part to the popularity of VisiCalc, originally designed only for the Apple II.

Apple II forever! is the Apple II's new battle cry; *The Endless Apple* shows you the way.

▶ BOOK EXCERPT/BY CHARLES RUBIN

the endless APPLE

PART ONE

Remember when you first got your Apple? Chances are it was your first personal computer. Remember your sense of delight and wonder as you opened the boxes and set everything up for the first time? This wasn't just a new toaster or television set. This was a computer: It was something that just might change your life, and would, at the very least, offer an endless and exciting new territory for you to explore. Maybe you got so excited you stayed up half the night with your new machine, plugging in peripheral devices, diving into manuals, watching words and pictures on the screen change at the touch of a key. For hours, days, or perhaps even weeks, your new Apple was the most amazing thing you'd ever seen.

Then something sad, but rather inevitable happened: You got used to your Apple. Like anything new, the Apple didn't stay new forever, and that sense of wonder and excitement faded. You got up to speed on your spreadsheet program. You began concentrating on the work you'd bought the Apple to do, and the once endless possibilities of your Apple were buried under specifics, such as keeping the books and writing letters. You forgot about what your Apple *could* do, and formed a concrete opinion of what it *did* do. In effect, you put your Apple back into a box—in this case, a mental box—only days or weeks after you first unpacked it.

People like to put things in boxes: We tend to form an opinion of what something will and won't do, and then forever after we think of it in those terms. This attitude is convenient and perfectly harmless with a toaster or a television, because they don't do much anyway. But it's asking for trouble with a computer, particularly with an Apple. Putting your Apple into any kind of mental box means you're turning it into an unchanging object. If you think of an Apple as you do a television set, you'll feel the same way about improving it—if you want something different, you buy a new one. And that's a shame, because flexibility has kept the Apple II new for all these years. And it's a flexibility that could, with a little imagination, keep you computing happily forever.

Out of the Box

Renewing and maintaining a love affair with an Apple II is a three-part process:

MICHAEL SANCHEZ

1. You change your attitude about your Apple.
2. You change your attitude about the computing you do.
3. You change your Apple.

The first two parts of this process are required; the third part is optional. If you open your eyes to the variety of things an Apple II can do, and the variety of ways it can do them, you'll begin pulling your computer back out of that mental box it's in.

Except for the monitor, disk drives, and perhaps the power supply, it's entirely possible that your Apple will outlive you.

You and Your Apple

One totally untrue but perfectly understandable attitude you may have about your Apple is that, as a seven-year-old computer, it isn't worth enhancing. You could point to the growing percentage of new products devoted to other computers. You could cite the trend toward larger, more elegant programs that require a 16-bit processor. You could be worried that your aging Apple isn't physically up to being enhanced, much as an engine with 100,000 miles on it isn't up to being supercharged. You might even mention the new Apple IIc as proof that Apple's support for the old II is finally evaporating.

This attitude is reasonable, but unsupportable. If you want a 16-bit processor, you can go out right now and get one for your Apple II. In fact, you may soon be able to replace your Apple's 8-bit processor with a 16-bit version that will still run your old 8-bit programs *and* give you access to more RAM. As for physical infirmity, electricity is not gasoline. Electronic devices last a lot longer than mechanical ones, and most of your Apple is electronic. Except for the monitor, disk drives, and perhaps the power supply, it's entirely possible that your Apple will outlive you.

And as for the new IIc filling the IIe's shoes, that's like saying Cadillac will stop making big cars because it now makes a little one. As conceived, the IIc fills a niche in the Apple II product line; it doesn't become the product line itself. Apple's marketing people see the IIc as a smaller, lighter, easier-to-learn, and *less expandable* version of the Apple II.

The IIc was designed as a sealed unit into which users can plug exactly one mouse, one modem, one external disk drive, one printer, and one monitor. The IIc costs less than a IIe equipped with an 80-column card, disk drive, and monitor, but it costs more than a IIe by itself. The IIc is fine for people who can confidently predict that they'll never need more than what it offers, but it isn't as well suited as the IIe for individuals, small businesses, and schools that want to keep their options open. And for beginners with the least amount of money to spend, a "stripped" IIe is still the cheapest way to Apple computing.

If all this sounds like the folks at Apple plan to keep the expandable II around for a while, it's because they do. Recent additions to the Apple II line, such as ProDOS (an enhanced operating system), the Apple Mouse, and AppleWorks (integrated software), all point to the future. Ongoing work by Steve Wozniak and others will soon result in products that will make the Apple II look and work amazingly like the Macintosh and Lisa, and this enhancement work shows no sign of abating.

When the IIc was announced in April 1984, Apple Computer took great pains to reposition the entire II product line as a family with a future. The Apple II line now has an installed base of over two million units, so the market is simply too big to walk away from. Indications from every sector of the personal computer market are that the Apple II will continue as a viable product through at least 1990. For individual computing needs, some would say it has never been bettered.

Enough Is Enough

This brings us to the second stage of the process—a change in your attitude toward the computing you do. A little more difficult, but no more expensive, it's a matter of stepping back from your computing and considering the difference between meeting your needs and buying products that go well beyond them.

Because computer technology changes so quickly, and because we're constantly exposed to advertisements for new hardware and software, we tend to think our problems can be solved only by buying something new. If we're not happy with the spreadsheets we design, we're more inclined to go shopping for new software than we are to consider re-reading the manual to get more out of our existing software. If we don't like the way our word-processed text is displayed, we'll consider getting a new computer before we explore other options. Part of this attitude comes from a lack of awareness of our other options (this book will help a lot in that department), but a lot of it is just plain consumerism and a desire for something new.

The proof of this is that we often find ourselves lusting after new products when our old ones are still perfectly good. A neighbor gets an IBM PC, and suddenly we're unhappy with our Apple. An increasing percentage of new software seems to have been written for MS-DOS, and we worry about being outdated, forgetting that our Apple is as useful and as reliable as ever. We are dazzled by 16-bit technology, even though it has virtually no effect on the quality of our word processing. We fall in love with huge spreadsheet/graphics programs, knowing that we never create large spreadsheets and never use graphics. We get carried away by doodads, such as screen icons and larger disk drives, whether we need them or not.

We often find ourselves lusting after new products when our old ones are still perfectly good.

The first thing to consider in evaluating a change in computers or a change to your Apple is the difference between what you want and what you need. But assuming you've got all the money in the world and can switch computers whenever you like (and you don't care whether you really need a new one or not), there are other reasons to resist the temptation. You've got a lot of learning time invested in your Apple, in both the hardware and the software. You've also got a considerable amount of personal data stored on Apple disks. You're comfortable with your Apple and can make it do your bidding quickly and easily. A new computer might temporarily quell your lust for the latest, but it will also force you to

Why Are Apple Owners So Loyal?

People who have the best often are, but in the case of Apple there's more. Apple owners think back to how Apple got started in 1977, just two people working out of a garage and what happened is the talk of Wall Street and the computer industry as well. Many like the fact that Apple only makes computers. Unlike their competition, they don't make typewriters, copiers or telephones. They do just one thing and that's one reason they do it so well.

At Applied Engineering we think the same way. You see, Applied Engineering is the only major hardware manufacturer totally dedicated to the Apple computer. Whereas most of our competitors must divide their customer support and engineering time between IBM, Atari, Radio Shack or other computers, our engineers only design products for the Apple. This dedication allows us to be much more familiar with the Apple and those who use them.

We don't expect you to buy an Applied Engineering peripheral on loyalty alone, but when you compare our products to those made by QUADRAM, MICROSOFT, AST and others you'll find out why Applied Engineering means a quality design, innovation, craftsmanship and total Apple compatibility.

The other guys do pretty well considering how busy they are with IBM. But at Applied Engineering, ALL of our work involves the Apple. In fact, all of our employees were Apple owners before they came to work for us. The people in shipping, engineering, quality control, order entry, all use Apples at work and at home.

This one track mindedness of ours allows us to offer the largest storage with AppleWorks and Visicalc and our Z-80 card now includes the new 4.0 operating system. We can expand the Apple IIe to over 1 MEGABYTE of memory and we've got clock cards, music cards, A to D converters, digital controllers, and a BSR system so your Apple can control your whole house with no additional wiring!

Applied Engineering recognizes that we've got to do a better job than our IBM counterparts because we know you're smarter than the average computer buyer, you bought an Apple. You see, our competition has it a little easier, their customers aren't as smart as you. After all, they bought the wrong computer.

So if you need more memory, or 80 columns, or RGB color, double hi res graphics, if you want to know the time and temperature or other "real world" conditions, if you'd like to run CP/M software, 68000 software, have a RAM disk, increase the storage of AppleWorks or Visicalc, if you want your Apple to play music, talk and sing, if you'd like your Apple to control the lights and appliances in your house, then do what NASA does, what Ford does, what the U.S. Government, Hughes Aircraft, Honeywell, Westinghouse, AT&T, and even what Apple computer does. Call Applied Engineering. Then you will discover what thousands of companies and tens of thousands of Apple owners already know, that you can be smart and loyal all at the same time.

invest a lot of time in learning a new system, finding ways to transfer your Apple disk files, figuring out new software, and generally getting comfortable again. The transition is difficult to make, and should only be undertaken as a last resort. As you'll see, it won't be necessary in most cases.

When Enough Isn't Enough

Realistically, though, there are times when it's better to get a new computer than it is to enhance your Apple. Perhaps your computer is part of a system of computers, and you need greater compatibility. Perhaps you absolutely must have a program that isn't available for the Apple—although there aren't many of these—and your need outweighs the disadvantages of making the change. If so, you'll have to face the music.

If you're a typical Apple owner, you've barely begun to tap the potential of your system.

If you decide to enhance your Apple, you'll need to learn the how, why, and what of making the enhancement. You'll want to consider your options. These might be exclusively a matter of price or of features that differ between specific products, or they might involve significant differences between types of solutions.

Then, too, there's the Kludge (pronounced klooj) Effect to consider. A kludge arises from a situation in which modifying or enhancing your Apple causes more problems than it solves. Sometimes (usually after looking at too many hardware advertisements) I have a nightmarish vision of my Apple with all sorts of wires dangling from it, smoke rising from the motherboard and seeping through the case. My vision is of a kludge: an inelegant, inefficient, and generally troublesome computing device.

An Apple II is by no means a kludge. It takes some doing to make it one—but it can be done. Sometimes, a product that enhances one application will mess up another application. A speed-up circuit board that helps spreadsheet recalculation renders your favorite arcade game unplayable, or a monitor that does wonders for graphics makes text harder to read. In presenting hardware and software solutions throughout this book, I have tried to keep a sharp eye out for the Kludge Effect, and to cry foul when it rears its ugly head.

What's far more likely is that an enhancement product is simply more trouble to use than it's worth. If you have to start your Apple with a modification disk and then enter half a dozen control-character strings every time you want to use your favorite software, it simply might not be worth the trouble. You might well be tempted to give the Apple to the kids and get another computer instead. This is entirely reasonable in some cases—it will depend on your particular circumstances.

But, if you're a typical Apple owner, you've barely begun to tap the potential of your system. There are thousands of products on the market that can make your computer easier or more fun to live with, and there are products yet to be

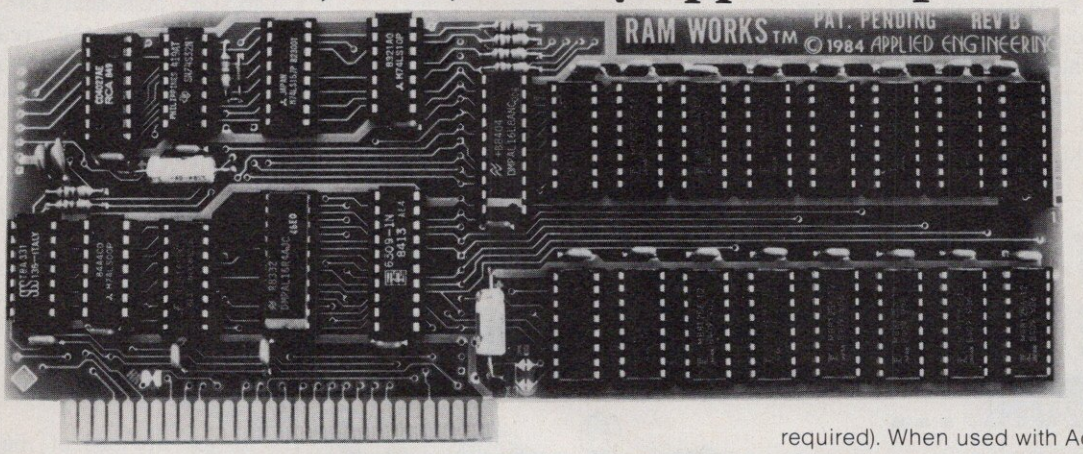
RAMWORKS™

800K Apple Works Desk Top, 450K Visicalc, 1 Meg Solid State Disk Double Hi-Res, RGB, Totally Apple Compatible!



RAMWORKS™—A card that plugs into the Apple IIe auxiliary slot and functions EXACTLY like Apple's extended 80 column card (in fact, a 128K RAMWORKS™ actually costs less than Apple's 64K extended card) but with RAMWORKS™ you get more memory, 80 column text, a 3-year warranty and most importantly, room to grow without using more slots. A design so advanced there's a patent pending on it. If you have a IIc or an IBM, we suggest you do what everybody does, trade it in on a IIe.

RAMWORKS™ can be purchased in a wide range of sizes and is user upgradeable using either 64K RAMS or the new 256K RAMS. In fact, RAMWORKS™ is the only auxiliary slot card on the market that will allow the new 256K RAMS to be used. If you already have an extended 80 column card, no problem. Just unplug the 64K RAMS and plug them into the RAMWORKS™ for an additional 64K. A RGB option is also available, you can order it with your RAMWORKS™ card or add it on at a later date.

RAMWORKS™ saves you time, money, slots and hassle. You'll have additional memory NOW and in the future.

LOW COST SOFTWARE OPTIONS

Ram Drive IIe

Ram Drive IIe will give you a high speed solid state disk drive. The Ram Drive IIe software features audio-visual access indicators, easy setup for turnkey operation, and easy menu driven documentation. The program can be modified and is copyable. If you have a 64K RAMWORKS™, Ram Drive IIe will act as half a disk drive. If you have a 128K or larger RAMWORKS™, Ram Drive IIe will act as a full disk drive. Either way, your programs will load and save over 20 times faster. Ram Drive IIe is compatible with APPLESOFT, PRO DOS, DOS 3.3, and PASCAL. The disk also includes a high speed RAMdisk copying program. Ram Drive is another disk drive only 20 times faster. And no whirring, clicking and waiting! **PRICE $29**

CP/M Ram Drive IIe

CP/M Ram Drive IIe is just like the Ram Drive IIe above, only for CP/M.

CP/M Ram Drive IIe runs on any Z-80 card that runs standard CP/M i.e. Applied Engineering Z-80 Plus or Microsoft Soft Card. CP/M Ram Drive will dramatically speed up the operation of most CP/M software because CP/M normally goes to disk fairly often. Fast acting software like dBase II, Wordstar and Turbo Pascal becomes virtually instantaneous when used with CP/M Ram Drive. **PRICE $29**

VC IIe Expander

VC IIe expander gives owners of Visicalc IIe and Advanced Visicalc IIe increased storage. When used with VC IIe you'll get 141K workspace (128K RAMWORKS™ or larger required). When used with Advanced VC IIe you'll get 131K with a 128K RAMWORKS™, 250K with a 256K RAMWORKS™ and 450K with a 512K RAMWORKS™ **PRICE $29**

Apple Works Expand

Although Apple Works is compatible with all sizes of RAMWORKS™, Apple Works only "sees" its first 64K bank giving you a 55K desktop. Our Apple Works expand program will make a modification to Apple Works that simply lets it know you've got more memory, giving you 101K work space. **PRICE $29**

Super Apple Works Expand

This souped-up version of Apple Works expand doesn't stop at a 101K desk top, in fact Super Apple Works Expand figures out how much memory your RAMWORKS™ has to give Apple Works the following desktop sizes:

RAMWORKS™	APPLEWORKS DESKTOP
128K	101K
256K	200K
512K	400K
1 MEG	800K

PRICE $39

AppleWorks can also be put in the RAMWORKS™ card to eliminate disk access, thereby dramatically speeding up the program.

exploited that will be truly mind-boggling. There's a lot of computing power and convenience still locked up in your Apple. Here's to unleashing it.

SUPERIOR SPREADSHEETS

To anyone whose business involves working with numbers, a spreadsheet program is invaluable. "How much money do I have coming in? How much do I have going out? Where is it all going, and what would happen if . . . ?" Those are the kinds of questions a spreadsheet program helps you answer—quickly, cleanly, and without sheet after sheet of ledger paper and roll upon roll of calculator tape.

To anyone whose business involves working with numbers, a spreadsheet program is invaluable.

VisiCalc was the first spreadsheet program to become available. In fact, it was the fuel in the personal computing rocket, and for nearly a year after VisiCalc's introduction in May, 1979, the only rocket in town was an Apple II. The story goes that Dan Bricklin and Bob Frankston, the creators of VisiCalc, needed a loaner computer upon which to run their program. They borrowed an Apple. And so it came to pass that business people, accountants, educators, financiers, and investors everywhere saw VisiCalc, found it good, and bought Apples.

Until VisiCalc was overtaken by second- and third-generation products (Multiplan in 1982 and Lotus 1-2-3 in 1983), it was the best-selling spreadsheet program. VisiCalc is still in wide use today.

If you are one of the hundreds of thousands of VisiCalc owners, you have a product that was truly revolutionary in its time, but might now be a bit dated. Its standard display, designed for a 40-column Apple II, will show you only four spreadsheet columns at a time. While VisiCalc has a theoretical maximum model (spreadsheet) size of more than 16,000 cells, the actual model size is dictated by the amount of RAM available; on a 64K Apple, that's 34K, or about 1000 cells. Once you become familiar with VisiCalc and begin creating larger and more sophisticated models, that 1000-cell limit can become a problem. For some people, it's like having a four-function calculator on which only the addition function is working. In certain situations, the size limitation can even be embarrassing.

1-2-3, Is It for Me?

Say you've happily been using VisiCalc at the office for four years now, but the upstart next door has just gotten herself an IBM PC. She's loaded it up with 512K of RAM, learned Lotus 1-2-3, and is now creating monster spreadsheets that seem to recalculate in nothing flat. When she forgets a command, she has immediate help at the touch of a key, and she can whip out a nicely colored pie chart in a couple of minutes.

Everywhere you turn, it's IBM and Lotus, IBM and Lotus. You recognize a preponderance of Lotus spreadsheets turning up at the departmental meetings. You envy your competitor's IBM keyboard with its numeric keypad. You lust after that IBM display that shows eight columns instead of a measly four.

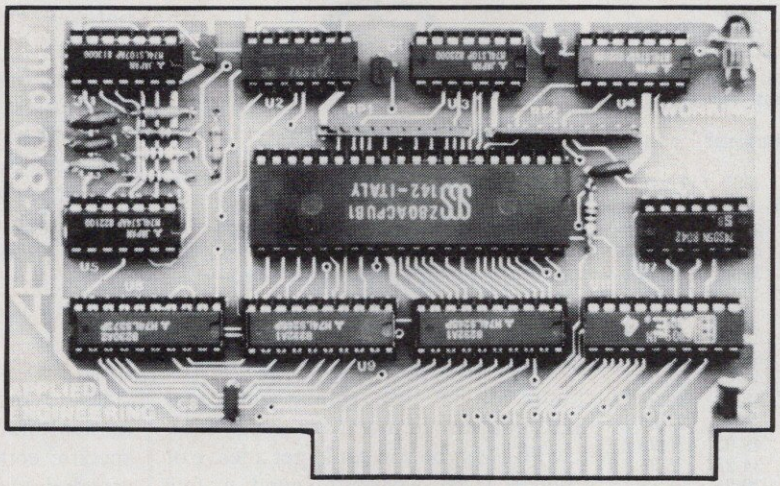
Z-80 PLUS
NOW INCLUDES NEW CP/AM 4.0™



Enter the CP/M world with the new Z-80 Plus card from Applied Engineering and introduce your Apple to thousands of new programs. Only the Z-80 Plus comes standard with the new 4.0 software, the most advanced system for running CP/M programs ever. Only CP/AM 4.0™ has advanced features like built-in disk emulation for popular memory expansion boards (those made by Apple and Applied Engineering and others) to give you a faster system with more storage. You also get menu driven utilities that are much easier to use than the older CP/M utilities so you can get down to all that great CP/M software faster. If you already own the Z-80 Plus, you can upgrade to the 4.0 software for only $29. The Z-80 Plus runs older CP/M programs too, down to Version 2.1 (2.2 is the most popular). With the Z-80 Plus you can run the largest body of software in existence. Simply plug the Z-80 Plus into any slot in your Apple. You'll have two computers in one and the advantages of both, all at an unbelievably low price.

- Totally compatible with all CP/M software.
- Executes the full Z-80, 8080 and 8085 instruction set.
- Fully compatible with Microsoft disks (no pre-boot required as with others).
- Does everything the other Z-80 cards do plus supports Z-80 interrupts.
- Specifically designed for High speed operation in the Apple IIe (runs just as fast in the II+ and Franklin).
- Red "CPM Working" LED indicator, the Z-80 Plus does not interfere with non-CP/M programs.
- An on-card ROM eliminates many I.C.'s for a cooler, less power consuming board.
- A semi-custom I.C. and a low parts count allows the Z-80 Plus to fly thru CP/M programs at a very low power level.
- Runs on any Apple II, II+ or IIe with at least 48K memory. Works with any 80 column card, but does not require one.
- The Z-80 Plus will allow you to run: dBase II, Wordstar, Spell Star, Cobol-80, Fortran-80, Peachtree and ALL other CP/M based software.
- Fast Clock: 4MHZ
- Documentation included
- High quality P.C. board, gold plated connector, all I.C.'s in high quality sockets, with mil. spec. components used throughout.
- Three year warranty.

With the Z-80 Plus, you can access the largest body of software in existence. Two computers in one and the advantages of both, all at an unbelievably low price.

CIRCLE 116 ON READER SERVICE CARD

You feel your once-keen analytical edge slipping, slipping . . .

You wake up from this nightmare in a cold sweat, determined to cashier the old Apple and switch over to the enemy camp. Maybe, you think, you could take out a second mortgage to pay for a new PC. Maybe you could get a leave of absence from work to spend a few weeks learning Lotus and transferring all your files to the IBM format. It all seems so drastic. Isn't there another way out?

Maybe, you think, you could take out a second mortgage to pay for a new PC.

Yes. There are lots of ways out. Which one you choose will depend on the kind of spreadsheeting you do.

What Do You Need?

What sort of spreadsheeting do you do, anyway? It's true that an Apple running VisiCalc with the standard 64K of RAM will only accommodate models of about a thousand cells, but maybe that's all you need. Maybe the Lotus-lover in the office next door builds monster worksheets because she's doing the whole division's budget projections for the next five years, and the budget has 700 line items. Imagine trying to remember which part of the spreadsheet contains the paper-clip projection for March, 1987.

And what about the time it takes to load and save files? The bigger the model, the longer this takes. Maybe you see her cranking out the graphics because the marketing people have found out she has Lotus and a three-pen plotter and she's a lot quicker than the art department. This is something you're actually yearning for? The point is that everyone does different things wth spreadsheet programs, and everyone doesn't need 1-2-3. Look before you lust, and don't fix things that aren't broken.

On the other hand, maybe your standard Apple really is cramping your style. As you've become a master model-builder, you've come to yearn for more RAM and bigger worksheets. You'd like to see more of the sheet on the screen at once. You'd like things to recalculate faster. You'd rather enter data with a numeric keypad, which you know by touch, than have to look at the number keys atop your Apple keyboard.

Software Problems

The first thing to do is look at your software and how you use it. Are you really making the best use of it? It's amazing how many VisiCalc users are disgusted by the slowness of data entry for years, only to discover one day that they can turn off the program's automatic recalculation mode and speed things up tremendously. People in this boat can clear up a major problem with one little command, but they'll never learn that command unless some angel rides to the rescue or they read the manual more thoroughly. If you have a specific complaint about recalculation speed, data flow, or an apparent lack of other functionality, the best place to start looking is the user's manual.

Improving your skills with a product you already know is infinitely less disruptive (not to mention less expensive) than starting all over again with a new product. The standard VisiCalc manual is an excellent and well-written guide, and there are dozens of tutorial books on the market to provide additional help. Specific problems with VisiCalc or other spreadsheets can also be cleared up by a local expert—doubtless a resident of the nearest computer store, or perhaps as close as the office down the hall.

If you have a specific complaint, the best place to start looking is the user's manual.

But suppose you're really up against the limits of the program. You want variable column widths, or the ability to name cells, or other advanced features. If so, you're in the market for new software. The easiest way to handle this is to get another product that runs on your unvarnished Apple, just as your old program did. You'll also want to make sure the new program can read your old spreadsheet files, so you can transfer your data. This is generally not

The TIMEMASTER II H.O., H.O. for short, has ALL the features of all the competition combined, including leap year, year (not just in PRO-DOS) month, date, day of week, hours, minutes, seconds and milliseconds. The H.O. is TOTALLY PRO-DOS, DOS 3.3, PASCAL and CP/M compatible. And yes, it works great with APPLEWORKS.

If you are using or writing software for other clock cards, no problem, the H.O. will automatically emulate the correct clock.

The H.O. works with ANY program that reads ANY* clock, and H.O. comes with two disks full of sample programs, including a computerized appointment book, a DOS dating program, interrupt programs, and over 30 others. We give the software others charge extra for, or simply don't have.

As a low cost option, you can add true BSR remote control to the H.O. giving you remote control of up to 16 lights and appliances in your home or office.

Is the TIMEMASTER II H.O. a simple, easy to use clock for beginners? Or a sophisticated high performance peripheral for the experienced? The answer is "YES". And when you think about it aren't those two products, the one you need now?

a problem. Beyond this, you should check out products that feature improved capabilities in the areas where you need them.

More Functions, Bigger Models

Microsoft's Multiplan is a cut above VisiCalc in the features department, and it offers a kind of solution to the size problem. Multiplan has better formatting capabilities, with features such as centering numbers in columns, and varying individual column widths. It lets you name cells and then refer to the names instead of the cell locations in formulas.

It can also sort entries in columns, and this ability is particularly nice if you use a spreadsheet for keeping personal records. If you use VisiCalc's windowing feature a lot to view different parts of a worksheet, you'll love Multiplan, because you can have up to eight windows on the screen at once, instead of VisiCalc's two. Multiplan also gives you an on-line help facility that describes major program commands.

Multiplan's solution to memory limitations is sheet linking. You can create links between cells or areas on an originating spreadsheet and a destination spreadsheet. When you load the destination spreadsheet, Multiplan automatically goes out to the disk, finds the originating spreadsheet, and copies the values from the linked cells. You can have several supporting worksheets for the final sheet.

With Multiplan, instead of using 1-2-3 to create a monstrous budget, for example, you could create several smaller categorized budgets and transfer the bottom line of each to a consolidated summary sheet that showed only the totals. Because they would be smaller, the individual sheets would be easier to move around in, and through linking, the consolidation sheet would automatically be updated every time you loaded it.

The major difference in Multiplan is that it uses menu-selected commands, instead of VisiCalc's slash commands. If you are used to VisiCalc, Multiplan's row and column designations and formula building are different enough from VisiCalc's to make it a little harder to get used to. The DOS 3.3 version of Multiplan can recognize up to 128K of RAM, so it will take advantage of extra RAM you might add to your Apple, but not as much as other products will.

MAGICALC, from Artsci, is an easier spreadsheet to move up to from VisiCalc, because it has slash commands similar to VisiCalc's, and it uses very similar formula-building techniques. MAGICALC breaks major spreadsheet functions, such as data entry and calculation, file management, and formatting, into separate modules you select from a menu; but since you're doing mostly data entry and calculation, this modularity doesn't slow you down too much.

One plus you'll notice right away with MAGICALC is that it can display up to 70 characters across a normal Apple screen, giving you six spreadsheet columns on the screen at once, instead of VisiCalc's four, without the need for you to buy an 80-column display card. MAGICALC can also access up to 512K of RAM, or twice as much as VisiCalc can handle. Other advantages include variable column widths and individually protected cells.

One plus you'll notice right away with MAGICALC is that it can display up to 70 characters across a normal Apple screen.

ProDOS

A software-related solution of another kind is Apple's enhanced ProDOS operating system. Most popular Apple spreadsheet programs are now or soon will be available in ProDOS versions. While the spreadsheet software itself may or may not be the same as it was under DOS 3.3, the way the program uses memory and loads files will be greatly improved. An Apple with ProDOS loads and saves files about six times faster than it does with DOS 3.3, so you'll spend a lot less time waiting to get large models off a disk.

But the best thing about ProDOS is the way it handles memory and storage devices. ProDOS has the ability to detect the amount of RAM available on any given Apple, and to access that RAM accordingly. Software developers will have to modify their programs specifically to take advantage of this feature when they convert their existing software to ProDOS, but since spreadsheets are so memory-intensive, any

ProDOS spreadsheet program you buy should give you automatic access to memory expansion cards. VisiCorp's new FlashCalc, for example, is a ProDOS program that will access up to 512K of RAM automatically.

The ability of ProDOS to detect and access extra storage isn't limited to RAM, though. If you buy a high-capacity floppy disk drive or a hard disk that supports it, ProDOS will allow you to take full advantage of the extra storage space automatically.

Since March of 1984, ProDOS has been the standard operating system shipped with new computers in the Apple II series. If you own an older Apple, you should be able to get ProDOS for a nominal charge.

Hopped-up Hardware

Despite the fact that most people don't need it, the ability to create larger spreadsheet models is the thing many Apple users crave most. This is such a common complaint that a whole mini-industry has grown up around finding ways to enable people to create larger spreadsheet models on the Apple II. If you really want to build bigger models and have them all in RAM at once, you'll have to add more RAM.

A Little History

VisiCalc was designed to run on a 48K Apple II, which was the biggest standard Apple in 1979. If you bought an extra 16K of RAM on an Apple Language Card, you could bring the total up to 64K, and VisiCalc would use this extra memory, but nobody was really thinking beyond this limit in 1979.

Since many "typical" spreadsheets (say, 20 columns by 50 rows) fit into somewhere between 64K and 128K of RAM, many VisiCalc users were soon bumping up against the 64K limit, and the third-party people began thinking of ways around it. They discovered that the Apple II treated its memory as one 48K chunk and—if you had the optional language card—one 16K chunk. VisiCalc fits neatly into the main 48K chunk with room to spare, so it used part of this main bank of memory and most of the 16K bank for storing your data. It was on this second, 16K bank that the developers concentrated.

The Apple's processor can only recognize 64K of RAM at any one time, but that didn't stop developers from figuring out how to swap the first 16K bank with other 16K banks. You could thus have part of a spreadsheet stored in the original 16K bank, and other parts of it stored in other 16K banks,

The ability to create larger spreadsheet models is the thing many Apple users crave most.

and simply swap the bank containing the part of the model you needed in and out of action when you needed it. Since the switch occurred at electronic speeds, you would never even know it was happening.

Working this magic was simply a matter of teaching the spreadsheet program to look for alternative 16K banks in which to store data, and then building add-in memory (add-RAM) boards that contained the extra RAM. (NOTE: The Apple IIe doesn't have this 48/16K RAM division; it switches

RAM in banks of 64K, but otherwise operates in the same way.)

Adding RAM

The following discussion of RAM assumes you have a 64K Apple (either a IIe or a II or II+ with the 16K Language Card installed). If you have a 48K Apple, getting a Language Card will be your first step. The Apple's memory-management system allows for the use of several megabytes of RAM via this bank-switching technique, so any limitations will more likely come from the software you're using and the depth of your pockets.

If you have a 48K Apple, getting a Language Card will be your first step.

Different spreadsheet programs use memory in different ways, and some have lower limits on the use of extra RAM than others. Multiplan will normally access models fitting into up to 128K of RAM; VisiCalc will let you build models up to about 220K in size; MAGICALC, FlashCalc, and a product from Videx called UltraPlan, will access up to 512K of RAM. MAGICALC, FlashCalc, and UltraPlan will access additional RAM without modification. If you're using VisiCalc or Multiplan with DOS 3.3 (rather than ProDOS), you have to start up with an additional software disk, called preboot software, that "teaches" these programs how to use the extra RAM and lets them know it's there to be used.

Some add-RAM boards come with pre-boot software included. Other manufacturers sell the software separately for as much as $100. Almost all preboot software disks contain the preboot "teaching" program, as well as extra, built-in programs that let your Apple use the extra RAM in other ways or that otherwise improve your computer's performance. Some of these extra programs, for example, let you save models larger than 143K (the maximum space on a standard Apple diskette) by watching for the disk to fill up and then prompting you to insert a new data disk before the saving operation continues. Others let you save and load spreadsheet files in as little as 20 seconds.

Some of this latter, fast-loading software, however, only works when you're loading or saving the contents of an entire disk, so you can't have any other files on the disk with your model. Loading a whole disk at a time is faster than finding and reading a specific file off a disk, though, especially when it's done in 20 seconds or less.

In attempts to make all that extra RAM useful for more than spreadsheets, add-RAM manufacturers also include what's called RAM-disk software in their offerings. This software fools DOS 3.3 into treating the extra RAM as another disk drive. When used as a RAM-disk, or pseudodisk, the extra RAM can store one or more data files and give you very fast access to them. Instead of having to go out to the disk drive, spin the disk, find the data, read it, and bring it back, your Apple can find a file and get it from a RAM-disk at electronic speeds—which, to you and me, means almost instantaneously. RAM-disks are very useful for

applications that require a lot of sorting or switching from one file to another. Many ProDOS applications have housekeeping programs, called utilities, that let you use a RAM-disk simply by specifying one as a storage option.

Titan Technologies (formerly Saturn Systems) and Legend Industries were the first companies to offer RAM boards and VisiCalc pre-boot software, in 1981. Since then, several other companies have gotten into the business; other major names are Quadram and Omega Microware. Add-RAM cards are available in sizes from 16K to 256K, and range in price from $100 to $700. These cards are frequently discounted up to 50 percent, particularly if purchased by mail order.

You're going to want to think hard about exactly how much RAM you'll need.

Obviously, though, at about $4 per 1000 bytes of storage, you're going to want to think hard about exactly how much RAM you'll need, or whether you really need it at all. Here are the major points in summary:

The Good News: You get the ability to build larger spreadsheet models all in RAM, with the attendant improvements in speed of recalculation and simply in moving from one area of the sheet to another. The other bonus is being able to use a RAM-disk with other applications. Extra RAM, by itself, won't have any negative effect on your other software or the rest of your computer, except for occupying one or more of the Apple's internal expansion slots (depending on how many additional boards you buy).

The Bad News: Depending on the spreadsheet program you're using (and whether or not it runs with ProDOS), you may need to use pre-boot software. With VisiCalc, for example, you would load the pre-boot software, and then remove that diskette and load your VisiCalc program.

With Multiplan, you would actually need to boot *three* diskettes to make use of extra RAM, because Multiplan's copy-protection scheme involves the use of a system diskette that must be loaded before you can load the actual program.

Many hardcore spreadsheeters are happily using pre-boot software and not minding the extra disk-loading. Whether or not you'll mind it depends on how much you use your spreadsheet. If you use the program for long periods of time, the pre-boot procedure won't be too bothersome. But if you switch back and forth between a spreadsheet and other applications all day, the whole process could get old fast. You know your requirements best. You be the judge. +

Apple® *II+* and *IIe* owners: Don't go to the computer store when you need more computer storage.

Go to the m

BUY THE SIDER™: 10 MEGABYTES OF FIRST CLASS MASS STORAGE AT A BULK RATE PRICE.

You need more storage for your Apple *II+* or *IIe* than a floppy drive can deliver. And you're about to head down to the local computer store to take a look at a hard disk file. Thinking hard disk, however, means facing some hard facts: It's going to be expensive, and you've heard that the state-of-the-Winchester-art isn't all it could be—especially in terms of reliability.

You and your Apple have a real need: If you're going to compute, you've got to store. But that doesn't mean hiking down to the computer store. Not any longer.

Here's the alternative. First Class Peripherals. *We have the finest, easiest-to-install 10-megabyte Winchester hard disk subsystem in the industry today, bar none. And we have it, direct through the mail to you, for the best price. Period.*

The Sider: Absolutely First Class, Inside And Out.

On the outside, The Sider is a compact, smart-looking complement to your Apple. And inside, that quality look is matched by true quality components.

There's the half-height 10-megabyte Winchester drive, for a start, with field-proven reliability, expansion capability, and offering direct boot from the hard disk. There's the best-selling intelligent controller in the business, with automatic data error detection and correction, internal diagnostics, optimal transfer rate between host and disk, and greater and faster system throughput with less software overhead. There's the steady power supply for day-in, day-out trustworthiness. And all components have been matched, tested and tested again, and designed into a "bookend" casing that doesn't even need a cooling fan.

Want to talk more tech? We could tell you about menu-driven installation, backup and restore utilities, flexible partitioning, FCC Class B approval, a wide range of operating system support and lots more. Suffice it to say that The Sider is a first class engineering achievement as well as a handsome, hard-working sidekick for whatever you and your computer need doing.

From Hotline To Swapline: A First Class Commitment To Support.

Our name is our commitment. We're offering a first class, one-year warranty on The Sider. No hassle. Full documentation. A toll-free hotline to answer any technical or service question you may have. Best of all, if there's any problem—repeat, any—that relates to the manufactured quality of The Sider, send it back and we'll replace it. Fast.

Here's Another First Class Idea: Order Now. 1-(800)-538-1307.

The Sider is going to sell like crazy. It's the right product. And—take a look at the first paragraph again—at the right price. No one else is going to make an offer like this for a long time to come.

So act now. Just fill in the order form or call our toll-free number. Harness the power of your Apple to the price/performance of The Sider. Now there's a team for you!

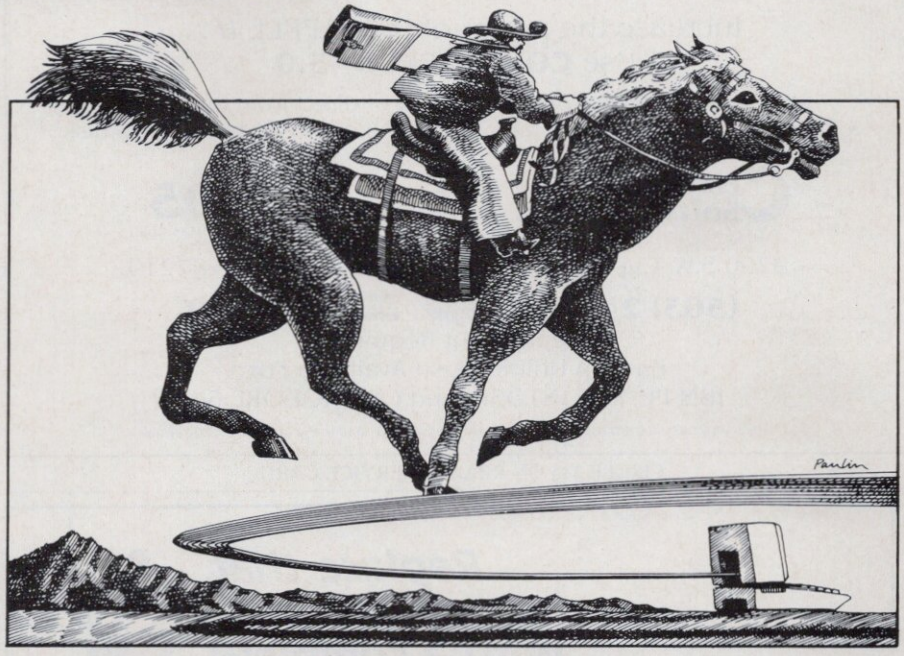
TELECOMMUNICATIONS OUTLOOK



DOUG PAULIN

This column is my first in 1985, and I would like to offer a few predictions about telecommunications in the coming year. By observing trends, we can reach some logical conclusions.

I am optimistic about telecommunications as a whole, especially in the business and educational sectors. Most companies and schools examine, study, and deliberate before making major decisions. Thus, they are one to two years behind the times when it comes to microcomputers.

Telecommunications is not one of the first applications that companies or schools get involved in when they purchase a computer. After they set up spreadsheets, word-processing programs, databases, and educational software, then telecommunications comes into play.

So why am I optimistic? The level of purchases in 1983 and 1984 appears to indicate that many companies and schools will attempt a foray into telecommunications in 1985 and 1986.

On the business end, companies will discover the wealth of information available to them. They will discover that they can receive and send a letter or document instantaneously—beating overnight service and even the new ZAP mail. Details that are so easy to forget during a phone conversation can now be sent electronically and stored on disk. No more "telephone tag"—the infamous routine of calling, leaving a message, stepping out for a minute, finding a message, calling back, leaving a message. Instead, you can leave the message in an electronic mailbox.

In schools, exchanging information about the best textbooks, software, and classroom strategies can benefit both teachers and students. Electronic seminars are available to all educators, from Maine to Alaska, at a much lower cost than renting a convention center and flying people in. Those who cannot attend the "live" seminar can download a transcript onto disk later.

And in the Home?

I am a little more cautious about the home market. It will grow, too, but probably not at the same pace as the business and school markets. Alas, cost is the major culprit.

Details that are so easy to forget during a phone conversation can now be sent electronically.

Home computers and telecommunications are upscale luxury items. Almost all computer-owning families can justify one-time costs for word processing or other applications, but few can afford to incur continuous hourly charges for telecommunications services. Unfortunately, I do not foresee a dramatic decrease in prices.

Furthermore, although have-it-here-yesterday businesses can benefit from the instantaneous transfer of electronic mail, most homeowners can get by with a 20¢ stamp and three-day delivery by the postal service.

Students are a bright spot, though. They can benefit the most from the wealth of information stored within telecommunications services. If they use the services prudently, they can keep the charges within acceptable bounds while increasing their knowledge.

A final point before we leave the Prediction mode and move on to some existing examples of telecommunications in action. Telecommunications is becoming simpler, yet more advanced, all the time. The bugs and intricacies of telecommunications programs and the information utilities themselves have

BUSINESSnet and SCIENCEnet

Omnet, an electronic-mail-management service based in Boston, operates two electronic-mail networks, BUSINESSnet and SCIENCEnet. As you might have guessed, BUSINESSnet is for businesses, and SCIENCEnet is for the scientific and engineering community.

Many educational institutions are participating in the SCIENCEnet network. For example, under the general heading of oceanography, some of the schools on the network include the Institute of Marine Science (University of Alaska), the Chesapeake Bay Institute (Johns Hopkins University), and the

Telecommunications is becoming simpler, yet more advanced, all the time.

Graduate School of Oceanography of the University of Rhode Island.

Both SCIENCEnet and BUSINESSnet use the GTE Telenet system, which operates from 250 cities and extends into 40 countries. Accessing the system is usually only a local phone call away.

For actual electronic mail, you use GTE Telemail, one of the easiest systems I have ever used. To send a message, you simply type COMPOSE, fill in the code of the mailbox or mailboxes to which you are sending your message, and start typing. Finish with a separate line containing only a period and a carriage return, and that's it—quick and easy.

SCAN ALL lets you see a summary of your mail, and READ lets you read it. Once you've read your mail, you can type ANSWER, in which case your reply goes directly back to the sender, or FORWARD, which sends the message to another mailbox that you name.

Note that you must insert a carriage return manually at the end of an 80-character line. Furthermore, you need the actual mailbox code, which makes sense if you are sending a message to an individual. Each mailbox is protected by a user-defined password, ensuring security and privacy.

BUSINESSnet and SCIENCEnet contain bulletin boards open to all users of the system. Each board is for a spe-

cific topic. You reach the board with the Check (board name) command, and the Read and Compose commands still apply.

Omnet carries a one-time setup charge of $75 per mailbox, or $500 for up to 15 mailboxes (add $10 for each additional mailbox). Mailbox fees are $15 per month, or $10 per month for more than 15 mailboxes.

Connect rates via Telenet are $15.40 per hour from 7 A.M. to 6 P.M., Monday to Friday; $7.70 per hour from 6 P.M. to 9 P.M. Monday to Friday, and weekends and major holidays from 7 A.M. to 9 P.M.; and $4.40 per hour from 9 P.M. to 7 A.M. every day. Additional charges apply for character storage, direct delivery, and multiple-message broadcasting.

Omnet is available via a toll-free (800) number at a higher charge. Higher rates also apply for service in Alaska, Hawaii, Puerto Rico, Canada, and Mexico. In general, users in the continental United States can expect to pay approximately $50 per month.

Omnet is a fine service for frequent communication within a selected group. It is all business or science and contains no games or databases other than what subscribers provide. Only executives or professionals should consider it.

On-Line Trivia

The trivia-game craze is well documented by now. Trivial Pursuit started a mania that no one expected. How successful is it? Look at all the board-game clones, not to mention the two dozen computer imitators.

It was only a matter of time before a trivia game came on line. The Whiz Quiz, produced by Grolier, the same company that produces an on-line encyclopedia, is now available on CompuServe.

The Whiz Quiz has three categories—Who Said That?, Sports, and Movies. It uses a multiple-choice format, asking a question and letting you choose from four answers. Not only does it provide the correct answer, but it also adds a nugget of information about the subject of the question.

For example, under Who Said That?, the program asks you who said, "I think, therefore I am." Was it Descartes, Voltaire, Rousseau, or Erasmus? If you answer *Descartes*, you are correct. The Whiz Quiz then follows with "Did you know that Descartes, with Pierre de Fermat, is considered the cofounder of analytical geometry?"

Too easy? Then who said, "To do injustice is more disgraceful than to suffer it?" Was it Socrates, Plato, Jefferson, or John Adams? It was Plato, who, incidentally, was a pupil of Socrates.

You receive a point total at the end of the quiz, and top scores are displayed. You can find the Whiz Quiz listed under Educational Games on CompuServe.

Parting Shots

I am enthusiastic about the potential of telecommunications, especially during this year. I look for increased awareness about what telecommunications can accomplish—for businesses, schools, and individuals. From relaxing trivia to instantaneous electronic mail, your modem and your Apple can bring you a wealth of education, entertainment, and information. ✚

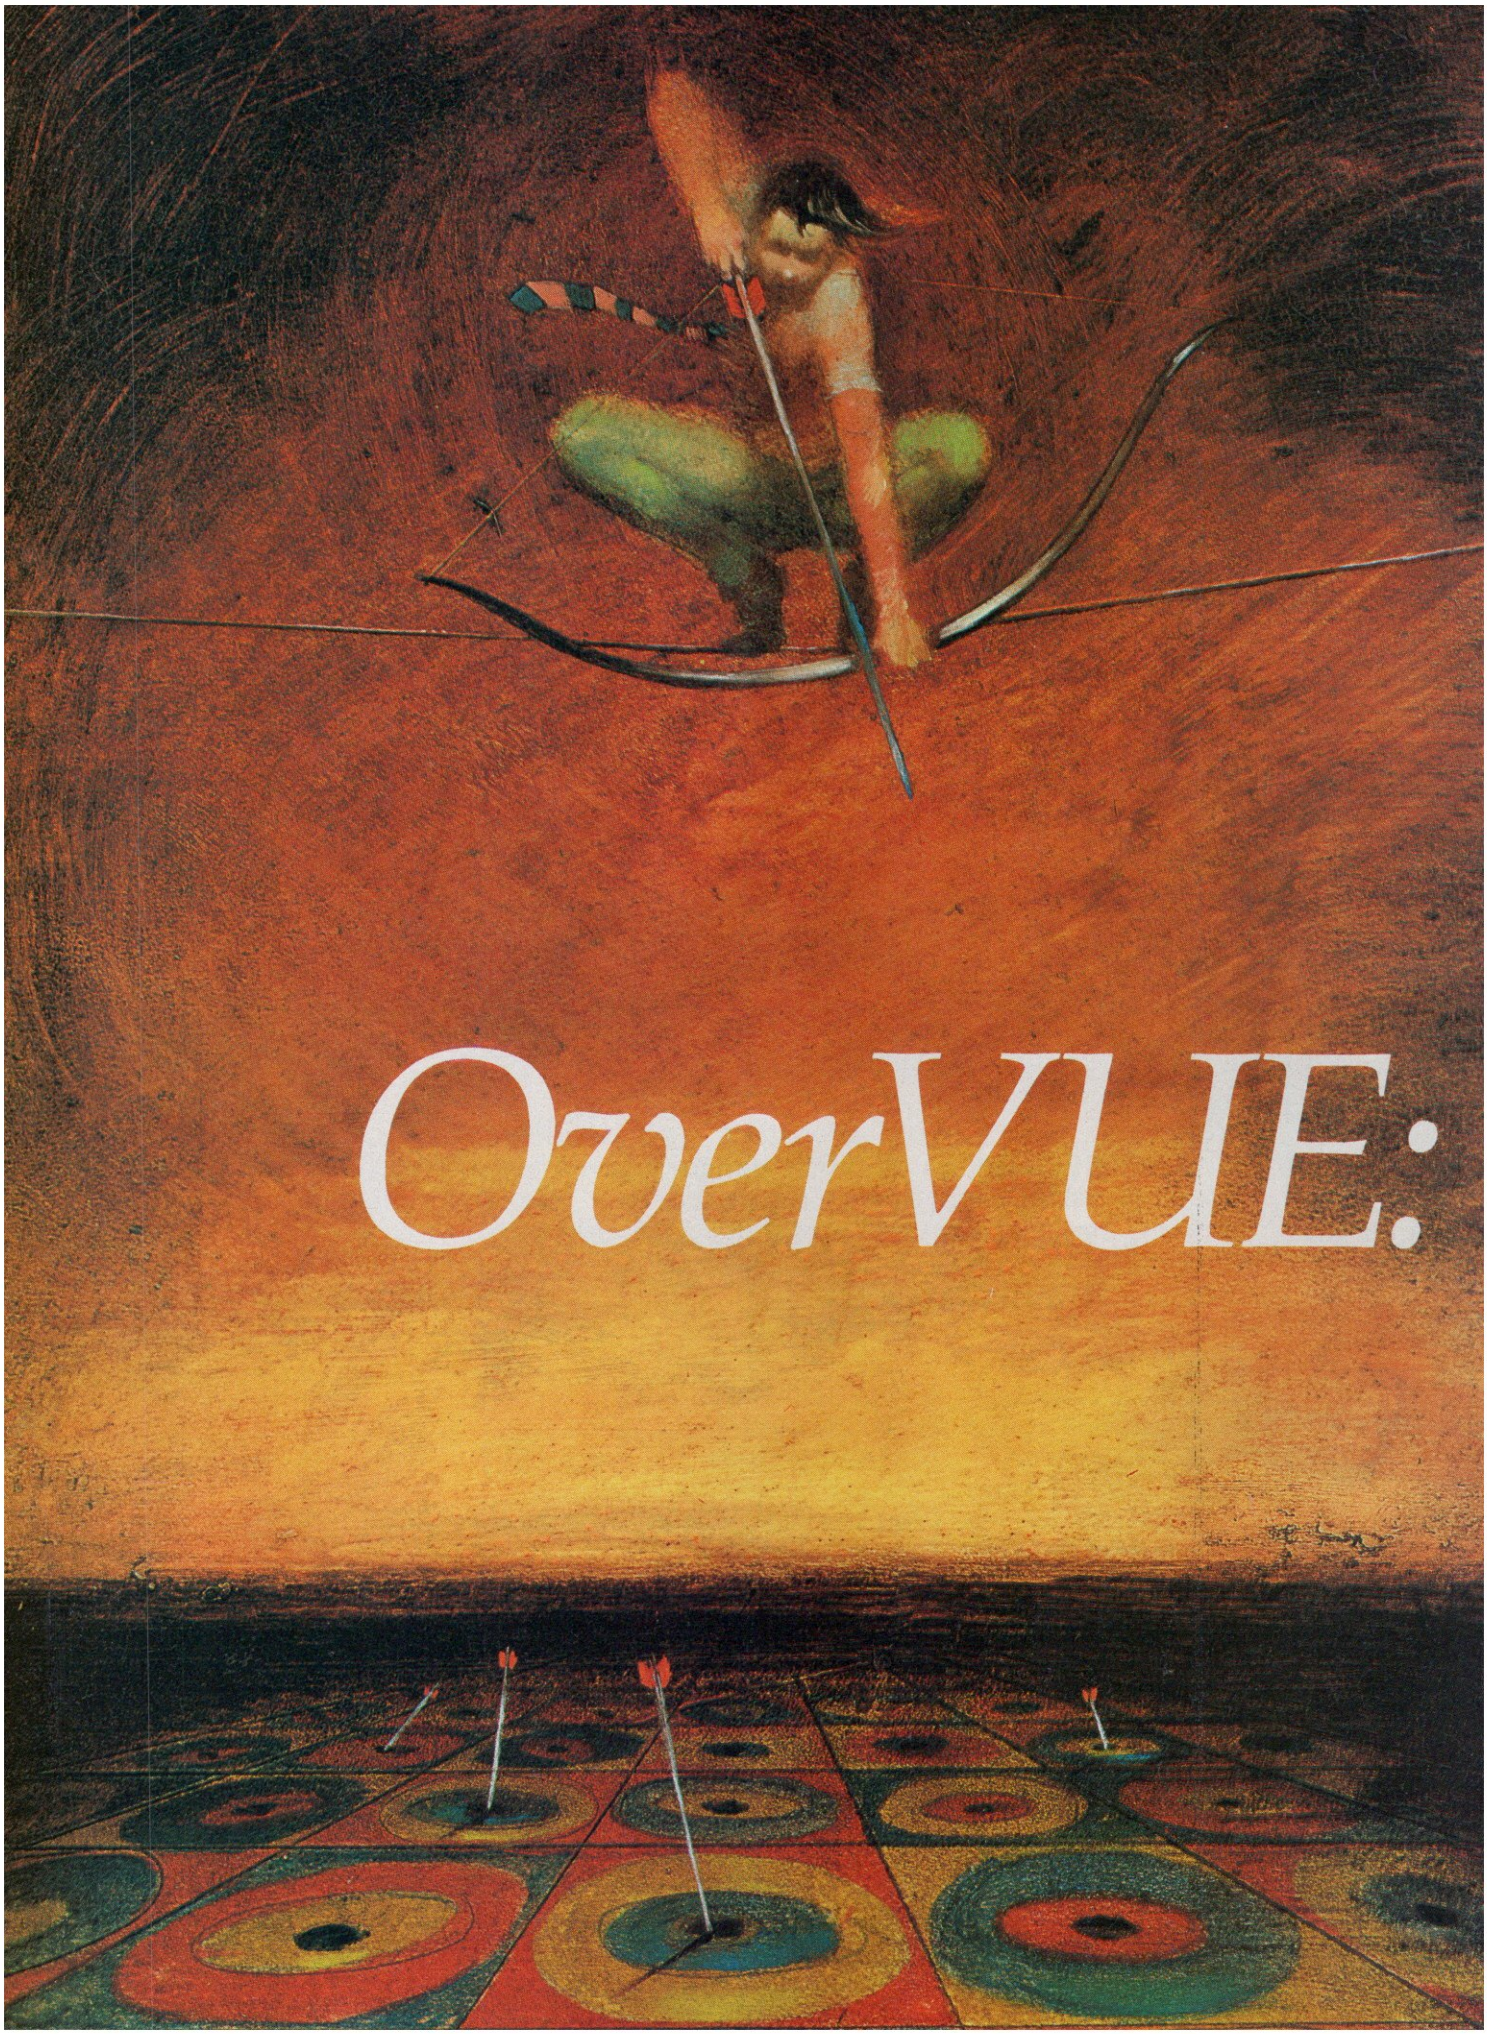
OverVUE: Targeting the Data-Management Market
More Introductory Programming
Three Communications Systems



OverVUE:

OverVUE, from ProVUE Development Corporation, is a powerful new data-management package for the Macintosh computer, geared especially for lightning-fast performance. OverVUE makes full use of the Macintosh's 32-bit processor to select, analyze, and sort information in a fraction of the time most other packages require.

At first glance, OverVUE looks more like an electronic spreadsheet than an information-management program because of its row-and-column structure and the way it organizes data records. Each individual record is displayed horizontally, with up to 64 separate columns for each field within the record. This arrangement allows up to 17 records to fit on the screen at once, yet it keeps all the data clearly organized. For longer records, when not all of the information can fit across the display screen, you use scroll bars to shift the display back and forth.

Targeting the data-management market

Speed Demon

Unlike most other data-management programs, OverVUE holds an entire file within the computer's working memory, which gives you much faster response than what would be possible if the file were held on disk. With OverVUE, operations such as sorting or locating specific records are not limited by disk-access time and execute in a fraction of the time that other programs take. In fact, OverVUE can sort a 1000-record file in less than two seconds.

You can also group records by category, with totals and subtotals for each, and analyze data for count, minimum and maximum value, and averages. All of the commands are easy to invoke and rarely take more than a second to complete.

OverVUE's design lets you sort or select records by any qualifier with equal ease. Disk-based files are often indexed by only one key field, which makes selecting or sorting by another field much slower. For example, if a disk-based address file were sorted alphabetically by last name, locating all the Smiths would be an easy task. Searching for records with a particular zip code would take much longer, however, since the program must scan each record individually to locate the correct choices. OverVUE can handle both situations with the same blinding speed.

This speed and flexibility is not without its price, though, since the maximum size of data files is limited by system memory In a 128K Macintosh, approximately 30K is available for file data, with the program itself occupying the rest of the machine's memory. OverVUE makes efficient use of the data-storage area by compressing the file into an area 20–30% of the size it would normally occupy. A typical data file might contain 600–700 records on a 128K machine and ten times that number with 512K.

Meant for the Mac

OverVUE is Macintosh software the way it was meant to be. Pull-down menus and dialog boxes are used intelligently throughout the package, making it extremely easy to master. For example, to sort an address file by last name, simply point to any entry within that column and choose Sort Up from the Analyze menu (see figure 1). The entire file is rearranged in the ascending order almost instantly. Conversely, selecting Sort Down arranges the list in descending order. Anyone who is familiar with basic point-and-click operations should be able to sit down with OverVUE and use the package efficiently in a matter of minutes. OverVUE is not a modified Mac version of some existing package; it was designed from the ground up for the Macintosh and takes full advantage of the machine's capabilities.

The program's documentation is also an example of classic Macintosh design. This 144-page, spiral-bound manual is packed with screen illustrations from cover to cover, with every command described and demonstrated in detail. Four sample data files on the program disk let you follow along with the manual and experiment with the various commands.

Designing a new data file is a simple task. Just type in the names you want to use as column headings and specify the width of each column (up to 62 characters) and you are ready to enter information. OverVUE can store a full 62 characters in any column, regardless of its width, although only the data that will fit within the allotted space is shown on the screen.

You can move columns from place to place even after you've put data into them, which means you can fine-tune the form design until it suits your needs. You can insert new columns into an existing file and delete unneeded ones just as easily.

In addition to the information you supply, columns can also display calculated data based on numeric or string arithmetic. So, for example, you can create a Total column based on values in a Price column multiplied by the contents of a field marked Quantity.

You can type any kind of data—alphabetic or numeric—into any column, but you can specify certain types of data as defaults. For example, a column of financial information

could be assigned the Money attribute, which would allow entry of numbers, dollar signs, commas, and periods only. There are also selections for yes/no responses, dates, and phone numbers (see figure 2). OverVUE lacks an automatic dating function, and you cannot access the Macintosh's built-in clock from within the program.

One option of the program converts text entries into uppercase letters, regardless of the way you entered them. Another possibility is to have the program make just the first letter of a text entry uppercase, which is ideal for names and addresses. In addition, OverVUE gives you full control over a column's display format, allowing you to move the column's contents to the right or the left.

You can arrange printed reports in a variety of formats, from an exact replica of on-screen information to mailing labels, financial summaries, and complex reports. Designing a print format is as easy as moving the field names around on the screen until they are in the positions you want (see figure 3). If you want to omit some part of the record from the printed report, just remove it with the mouse. If you want to include information that is not in the data file (such as Attn: on mailing labels), simply type it into the format design. You can design up to nine complete print formats and store them to disk. Each appears under its own name on the pull-down Print menu (see figure 4).

After experimenting with OverVUE for a while, I encountered several unnerving snags. One example is the Sort function, which sorts strings rather than numerical values. This method works well with text entries, but if you use it on a column of numbers, OverVUE is as sensitive to the physical length of an entry as it is to its numerical value.

In other words, during the sorting process, the program views the number 1.0 as being larger than the number 2. The same holds true for numbers preceded by a dollar sign or a minus sign. OverVUE places −10 above 30 and $3 above 4 because they are physically longer, even though they are numerically smaller. To remedy this problem, make sure all numbers have the same attributes and the same number of places after the decimal point.

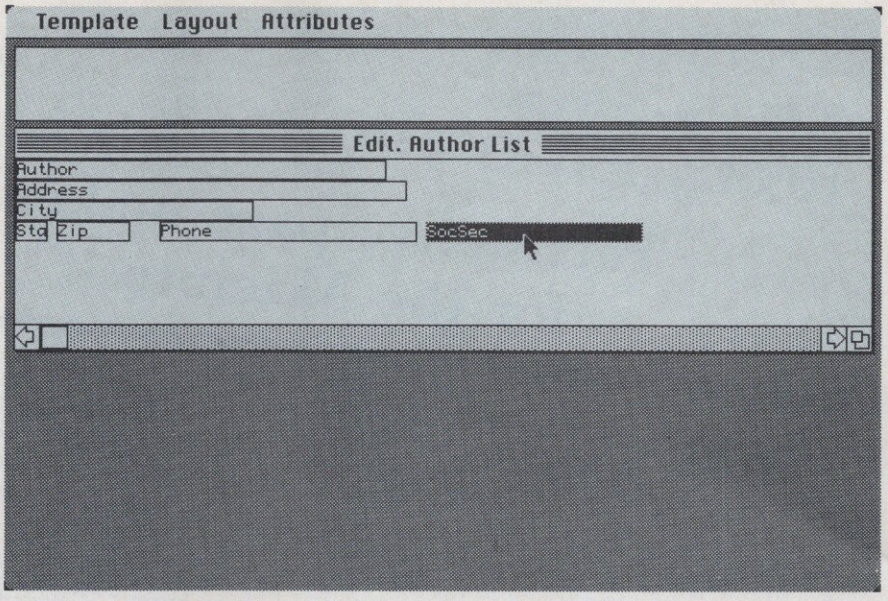

Figure 3: You can freely position fields with the mouse.

A related problem stems from the way in which the program displays data. You cannot specify easily that numeric data should contain a fixed number of decimal places. If you omit the decimal point and trailing zeros, the number will not appear in the proper form, nor will it sort properly if other numbers in the file are set up correctly. To get around this limitation, you can multiply an entire column by 1.0 for one place after the decimal point, 1.00 for two places, 1.000 for three places, and so on, to avoid having to type the decimal point and zeros for every entry.

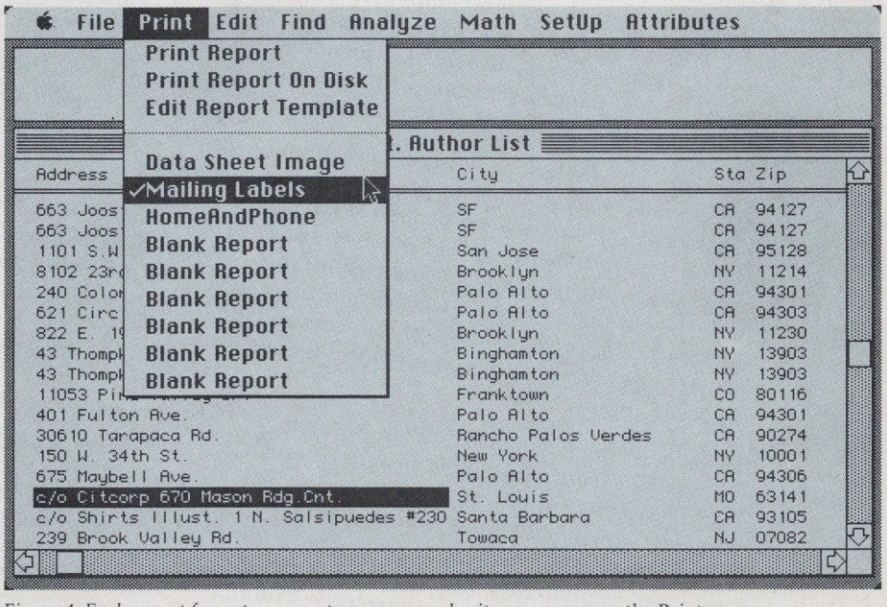

Figure 4: Each report format you create appears under its own name on the Print menu.

When you enter data or update existing records, the program makes it much too easy to delete a record completely. After you've selected any part of a record, tapping the backspace key deletes the entire record. The deleted record goes to the clipboard, so selecting Paste from the Edit menu retrieves the record.

ProVUE Development Corporation has several enhancements planned for OverVUE, including keyboard macros, relational capabilities for joining files, and a Zoom feature to let you focus on a single record in greater detail. According to company representatives, these features should be available by the second quarter of 1985, and upgrades will be available at a nominal charge for previous purchasers of the OverVUE package.

You can cut and copy data from OverVUE for use with other packages such as MacWrite. Unfortunately, the current version has no provision for moving data into OverVUE from another package.

Clearly, speed and ease of use were the main design goals behind OverVUE, and it succeeds at meeting these goals. If speed is not the primary consideration, however, the program's storage limitations and steep price may prompt you to consider a different software package. OverVUE is priced considerably higher than most Macintosh software; at $295, the package is no casual investment.

If you are looking for an easy-to-use—and exceptionally fast—system of selecting, sorting, and analyzing data, however, then OverVUE may be the ideal package for you. ✚

ReadySetGo™
ReadySetGo
ReadySetGo

Interactive page makeup for the Macintosh™

ReadySetGo™ automates the page design and pasteup process, turning the Mac environment into a **professional graphic arts publishing system.** The system overcomes limitations of current Mac programs (such as MacWrite,™ MacPaint™ and MacDraw™) encountered when trying to use those packages for sophisticated page makeup. ReadySetGo is ideal for projects requiring a considerable artistic design component on a page-by-page basis, such as **newsletters, reports, forms, flyers, brochures, ads, resumes, letters, papers, presentations and all page proofing and layout design work.**

Pages are built dynamically from component blocks which may contain **text** or **graphics.** The blocks can be dragged around the page and/or re-sized using the mouse. A ruler shows page dimensions for visual positioning of the blocks but a unique **specification sheet** gives each block's exact design parameters and allows very accurate positioning not possible with the mouse alone.

Text may be keyboarded from scratch or brought in from other Mac programs (such as MacWrite). Either way, the system provides full text editing features with the ability to change font, style and size at any point in the copy. All regular Mac fonts are supported in addition to **real typefaces** (currently **Times** and **Helvetica** with more available soon). When text is edited or a block re-sized, the display instantly updates to reflect changes and text automatically re-fits the block. Graphics blocks can contain rules, borders,

solids or pictures. **Pictures** can be brought in from other programs (such as MacPaint). All graphics automatically scale as their block is re-sized.

All standard page sizes are supported and a powerful **show page** facility provides a scaled view of the entire page. The show page display can be kept active concurrently with the actual page and is continually updated as work on the page progresses.

Pages may be stored on disk as full documents (design layout plus contents) or as "shells" (design layout only). The latter facility allows the user to reuse design templates or build an inventory of designs for future projects.

ReadySetGo pages can be printed on the Imagewriter or on **Apple's new laser printer** for superb publication quality output. Output support for the latest generation of typesetting devices is planned for the second quarter of 1985.

How to bring out the

Out of respect for your unbridled love of the Macintosh (and ours, too), we've created even more insanely wonderful ways to enhance its remarkable performance. With five easy-to-use, useful and totally captivating tools that take full advantage of the Macintosh's incredible capabilities. All designed to the Macintosh's high standards for quality and reliability. Priced to please the most discriminating Macintosh lover.

Mac·Daisywheel·Connection™

Now, with the Mac·Daisywheel·Connection, your Macintosh can print with any popular daisywheel letter-quality printer. Like the Apple Daisywheel Printer, the Brother (HR Series), the C-Itoh (Starwriter), the Daisywriter, the Diablo, the NEC Spinwriter, and the Qume (Letterpro and Sprint 11 Series)—just to name a few.

The Mac·Daisywheel·Connection gives you complete flexibility. You can keep your daisywheel and dot matrix printers connected to your Macintosh at all times. Just point and click to the printer you want to use.

The Mac·Daisywheel·Connection is ideal for business correspondence, reports, legal documents and even spreadsheets. It lets you print a full 15″ paper width. It comes complete with a program disk, a quick start-up guide and an interface cable. List price $99.

Mac·Spell·Right™

With Mac·Spell·Right, you can easily eliminate all the woes associated with checking and correcting spelling. This powerful new application program automatically does the work for you. Get the power of Webster's Dictionary and Roget's Thesaurus with the click of a button. Because Mac·Spell·Right works directly within MacWrite™ and runs transparently while you work, you never have to switch back and forth between disks and programs.

Think of how your productivity will improve. It won't take nearly as long to check and edit documents once you add "Spell✓" to the MacWrite menu bar.

And you may even find yourself with a little extra time on your hands to expand your vocabulary. Mac·Spell·Right gives you alternate word choices, too. List price $89.

Mac·Epson·Connection™

Thanks to the Mac·Epson·Connection, you can now use Epson dot matrix printers with your Macintosh.* Our new driver for high quality dot matrix printers will drive you wild, especially when you see how graphic

best in your Macintosh™

your graphics look and how professional your texts look. Nothing could be simpler or faster (at 160 characters per second). And it takes only 30 seconds to transfer the software to your 3½″ diskettes or hard disks.

The Mac • Epson • Connection is totally versatile, too. Anything you can print on the Imagewriter™ you can print on an Epson. The Mac • Epson • Connection is compatible with any software that runs between the Macintosh and the Imagewriter.

The Mac • Epson • Connection comes with a program disk, a quick start-up guide and an interface cable. List price $89.

*The Mac • Epson • Connection supports a wide range of printer models from Epson, including the FX 80 and 100, the RX 80 and 100 and the LQ1500.

Mac • Turbo • Touch™

The Mac • Turbo • Touch is a new high-speed direct input device (or, if you will, a turbocharged "mouse") for your Macintosh. This is not meant to imply that the legendary love affair between mouse and man is over. Rather, for those of you who are ready for something that can respond as quickly as you do, there is now an exciting option. An option that reduces the time it takes to edit a document by 40%. An option that covers the same ground the mouse covers in one-third the time and in one-fourth the desk space.

What's more, the Mac • Turbo • Touch is always right where you need it whether you're right- or left-handed because you can park it on either side of the keyboard. Where does it plug in? In the mouse port, of course.

Flexibility is only one of its many virtues. Responsive performance is another. The slightest touch of the gyroscopic ball positions the pointer quickly and accurately on the screen. Mac • Turbo • Touch makes MacWrite, MacPaint and any other software work better, faster and more precisely than before. List price $129.

Mac • Memory • Disk™

The Mac • Memory • Disk lets you access more of the memory in your 512K Macintosh. It makes interaction between software applications ten times faster. It also lets you allocate a portion of the RAM (Random Access Memory) resident in your 512K Macintosh and treat it like a disk. With the Mac • Memory • Disk, you now have immediate access to more memory. List price $29.

Mind Your Words!

You can magnify your writing abilities with Macwrite Version 3.3 and Mac•Spell•Right

While Macintosh owners and devotees who are waiting for a variety of word-processing packages are suffering from a severe case of delayed gratification, two new products offer immediate relief. Mac•Spell•Right from Assimilation Process and Apple's upgraded version of MacWrite provide some of the features previously unavailable to MacWrite users. A combination of these two products lets you create longer documents and check the spelling while you're at it.

What's New with MacWrite?

The two most important things about MacWrite Version 3.3 are that it is a disk-based system, which means document length is no longer limited to the 9–12 pages that can be held in memory, and, secondly, that it's free to current MacWrite owners.

Most of MacWrite's new features are for handling large disk-based documents. You'll notice that the scroll box has a number in it, indicating the page you are currently working on. The GoToPage # command included in the Search menu lets you move to any page in a document. The Search menu also includes a Find Next command, which lets you find words without the Find dialog box opening for every search. A box on the ruler lets you select text at six lines per inch—handy for preprinted forms and labels.

Another attractive addition to MacWrite is Format menu commands that allow you to select and align text without using rulers. You can, for example, select a line of text for a heading and choose Center from the Format menu (see figure 1). The alignment options for selected text are flush left; flush right; centered; full justified; or default, which will align the text according to the previous ruler. Eliminating the need for rulers for each alignment change is a real improvement. For all of us keyboard addicts, Apple has included optional keystroke commands to perform these operations.

How Many Is Too Many?

If longer documents are something you've been wishing for, as I have, allow me to share with you some foibles of the new MacWrite. As an inveterate writer of lengthy documents (in spite of MacWrite), I have adjusted to dividing them up into shorter files and joining them together at printing time. My dream has been to convert these truncated documents into one massive tome.

MacWrite 3.3 automatically converts documents created on an older version of MacWrite so they're usable on the newer version. When you open older-version files, the program informs you **This document is being converted and will open as Untitled**. Your original file on disk will remain unconverted. Once you've converted documents, you cannot open them anymore with the earlier MacWrite version.

I set out to consolidate my files to form my dream document. Alas, I forgot about the RAM limitation. Obviously, if you have a MacWrite document that is using most of your memory, you won't be able to copy the entire document to the clipboard to paste into another document. You may also encounter the first of several new and interesting dialog boxes: **You may only cut or copy 100 paragraphs at a time**. I happened to be working with a document that had a lot of carriage returns. As it turned out, I was able to copy only about 2½ pages of my file at a time. This process is tedious, but you probably won't be suffering through it very often.

I continued to consolidate, and I eventually encountered yet another interesting dialog box: **This operation will give the document too many paragraphs.** Too many is somewhere around 460 paragraphs. I was still dreaming about the great American novel, so I took to creating longer paragraphs. After all, I could create a document of considerable length if it had long paragraphs, right? Wrong. The next dialog box informed me **This operation will create a paragraph that is too long.** Paragraph length is limited to 3000 characters (slightly more than three-quarters of a single-spaced page). So, if I kept my paragraphs at the maximum of 3000 words, I could have a 345-page document, provided I had disk space to store it. In practice, with my short paragraphs, I couldn't get

beyond about 24 single-spaced pages—not my idea of a massive tome. Nevertheless, this version is a vast improvement over the original.

Management of larger documents would be easier if the new MacWrite had two more improvements. One is a Print Selection Only command, which would let you print a part of your file without making you cut out the rest. I'd also like to be able to open a second file at the end of an already open file—a possible solution to the consolidation problem. I expect these features on future upgrades.

Of the two kinds of people in the world (those who can spell and those who can't), I happen to be among the former; furthermore, I have editors. The idea of a spelling checker seemed questionable to me until someone pointed out that spelling checkers can find typographical errors.

If spelling or typing is the bane of your existence, you'll want to hear more about Mac•Spell•Right. The product is both a spelling checker and a thesaurus and works with the upgraded version of MacWrite. After you add Mac•Spell•Right to your MacWrite disk, you see an additional item on the menu bar when you open MacWrite. The menu is entitled Spell and has two parts called Check and Thesaurus. You can use both parts while you're working with MacWrite files.

Using the spelling checker is like using a Find command, beginning where you've set the insertion point. The words in your document are compared to the 40,000+ words in the program's dictionary. Whenever Mac•Spell•Right encounters a word that does not match anything in the dictionary, it highlights the word. When you choose Check from the Spell menu, you'll see a dialog box (see figure 2). Clicking on Find Next causes the program to highlight the next word in your document that it can't find in its dictionary.

When a word is highlighted, you have several options. If you're lucky enough to know how to spell it, you can correct it. If the word is properly spelled but not in the dictionary (e.g., MacGillicuddy, drosophila, pas de deux), you can click on Add Dictionary, which adds it permanently to the dictionary. You can supplement the dictionary with up to 1000 of your own words. If you click on Add Document, however, the word will be added to the dictionary only temporarily, remaining there until you close the document.

Mac•Spell•Right provides you with what Assimilation Process refers to as "the word most similar" to your misspelled word. This "similar" word appears in the dialog box after **Change to**. The program matches your misspelled word, letter by letter, starting with the first letter and working its way through the word. Thus, if you typed *highwau* instead of *highway*, the correct word would appear in the dialog box. Should you have the misfortune to spell *aficionado* with two *f*'s, however, the word in the dialog box will be *affidavit*.

The up and down arrows allow you to scroll through the dictionary to find the word you're looking for. If you suspect that the word requires only one *f*, you can scroll up and find the correctly spelled word. If you're a true nonspeller, however, and don't have the foggiest, the program won't be much help. It's another example of that old saw, "How can I look it up in the dictionary if I don't know how to spell it?"

If you do find the word in the dictionary, clicking on Change will replace your misspelled word with the correct one; you don't have to retype the word (see figure 3).

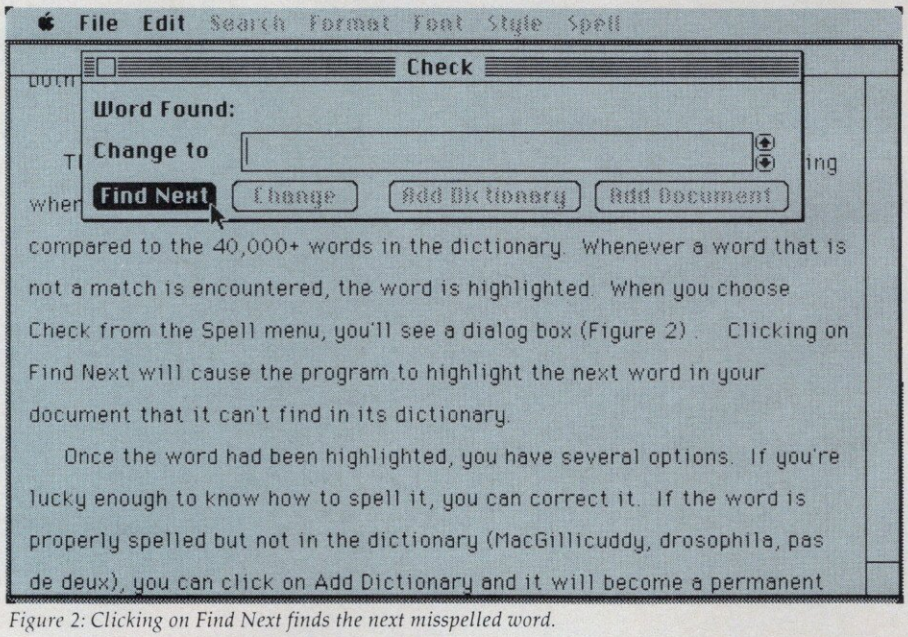

Figure 2: Clicking on Find Next finds the next misspelled word.

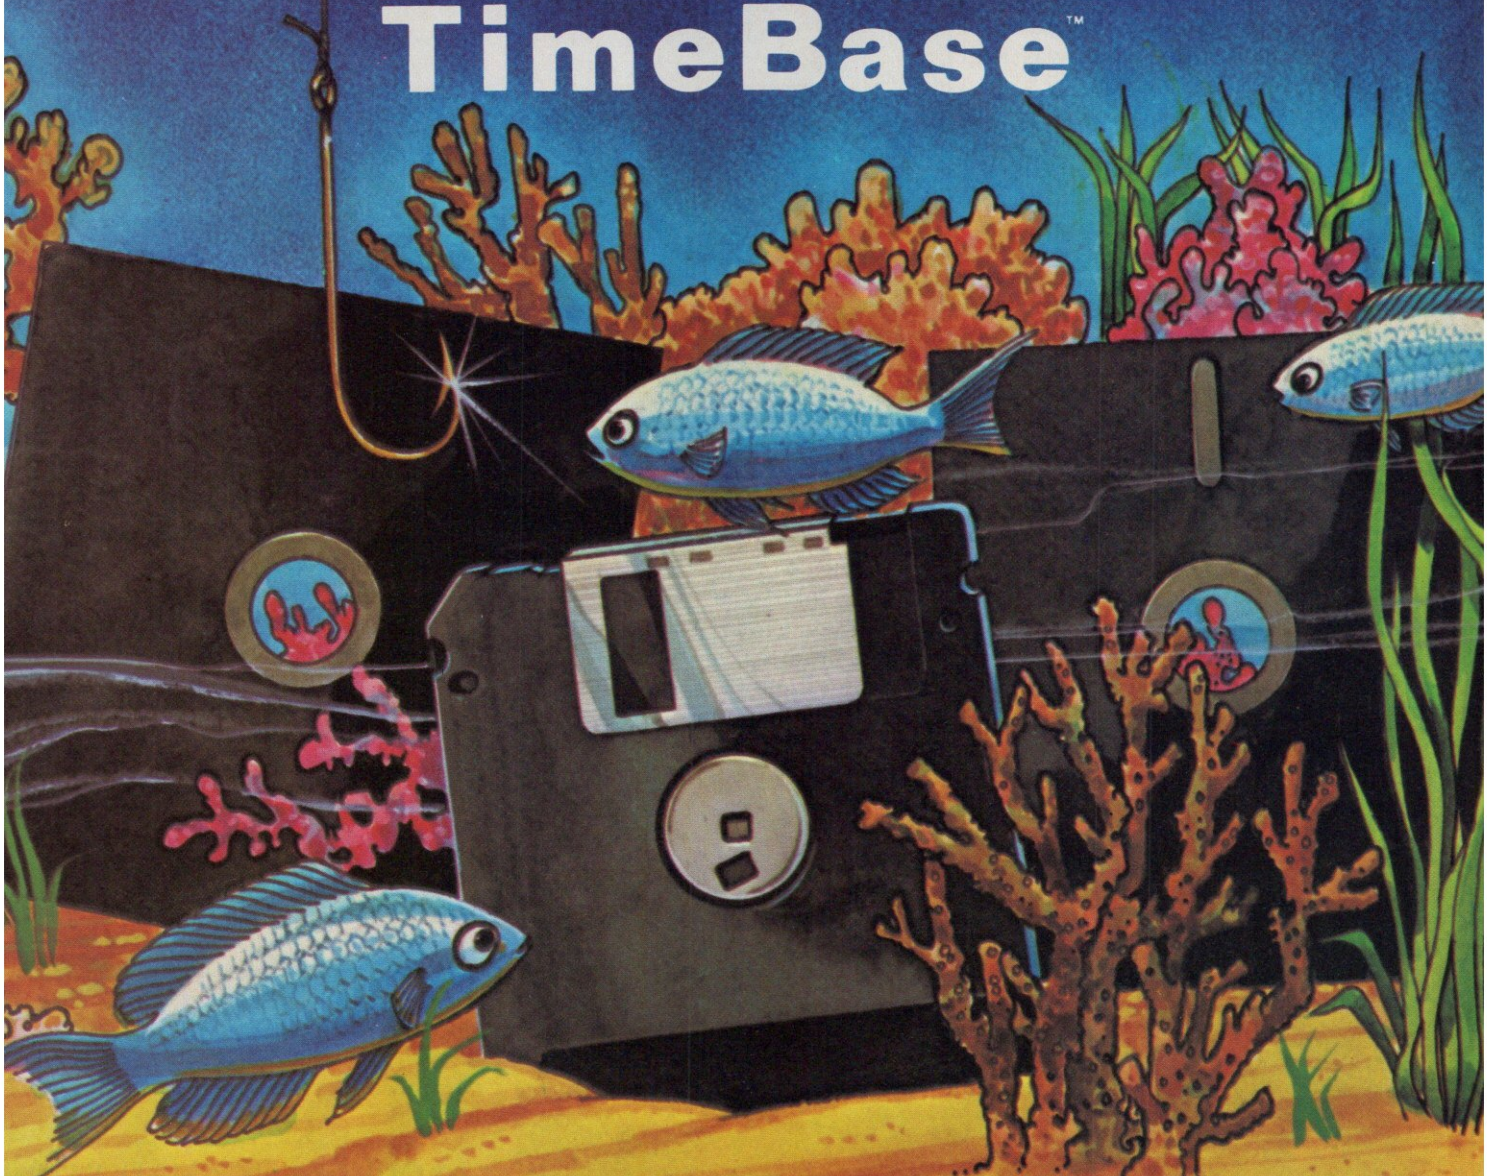
Don't go fishing for software that won't solve your problems.

TimeBase™



"THE WAIT IS FINALLY OVER!"

The selection of Macintosh™ software is growing daily. Now it's time to manage this software. Time to put information where it belongs, when it belongs!

Introducing TimeBase,™ the first "Integrated Software Centralizer" for Macintosh. This versatile time management system organizes your day-to-day business activities by interacting with your application software.

"FIVE EVERYDAY BUSINESS FUNCTIONS THAT SPELL ORGANIZATION."

TIME MANAGMENT

The first time manager of its kind. It keeps track of multiple daily, weekly and monthly schedules years in advance. Scheduling reminders, recurring appointments and priorities is a breeze. And since TimeBase combines five other applications, it does things previous time management programs only dreamt of.

INFORMATION MANAGEMENT

The Electronic File Cabinet manages up to 100 records or files. You can locate and print any record with a click, or print the entire contents in a report.

TMP™ (TRACKING, MAINTAINING & PLANNING)

Track information flow, call backs, accounts payable/receivable and deadlines. Maintain records and schedules. Even plan long and short term projects or events.

FORMS & LETTERS

A collection of ready-made forms and letters that includes: invoice, statement, memos, collection, sales order and more.

CENTRALIZATION

Interact information from your other Macintosh programs with your daily, weekly and monthly schedules. Whether it's your word processor, database, spreadsheet or any other, it's as easy as "cut and paste." The result is better management of time and information.

"TIMEBASE CAN DO *ANYTHING* YOUR APPLICATION SOFTWARE CAN DO . . . ONLY BETTER!"

How? By working with them and centralizing their functions. Why not get the most out of your software. After all, what good is your computer if you spend most of your time wading through "software slush?" Imagine being able to link information from almost any program to your busy schedule. This avoids the delay in having to insert different disks to access documents, files or records.

So if you would like to know more about TimeBase, the unique time and information management system, see your local computer dealer, or contact SoftDesign directly.

A random survey of a very small sample of my colleagues found no one who had used a thesaurus since college. Going under the assumption that I didn't need this product, I forged ahead. Using the thesaurus was easy, easier than using the one on your dusty bookshelf, and having synonyms at my fingertips was far handier than I'd imagined.

When you choose Thesaurus from the Spell menu, you'll see a dialog box with three columns of 15 words in it. This initial box of words is a window on the so-called Index level of the thesaurus. The list, which contains 16,000 words, has all the root words of the spelling checker's dictionary. Within this level, you can move to any letter of the alphabet by typing the letter of your choice or using the scroll box. Many of the words in the list are boldface, which indicates that they are "thesaurus entries." You can open them to get to the Category level of related words. For example, opening *document* presents four categories: *circumstance, evidence, record,* and *writing*. Opening the *record* category presents the Synonym level, which contains words related—quite loosely, in some cases—to *document* as a record and displays 135 words, from *account* to *yearbook* (see figure 4).

A pause button in the dialog box lets you stop the display at any time. Once you've found a related word you like, you can copy it for pasting into your document. To exit from the thesaurus, you'll have to click to close each level.

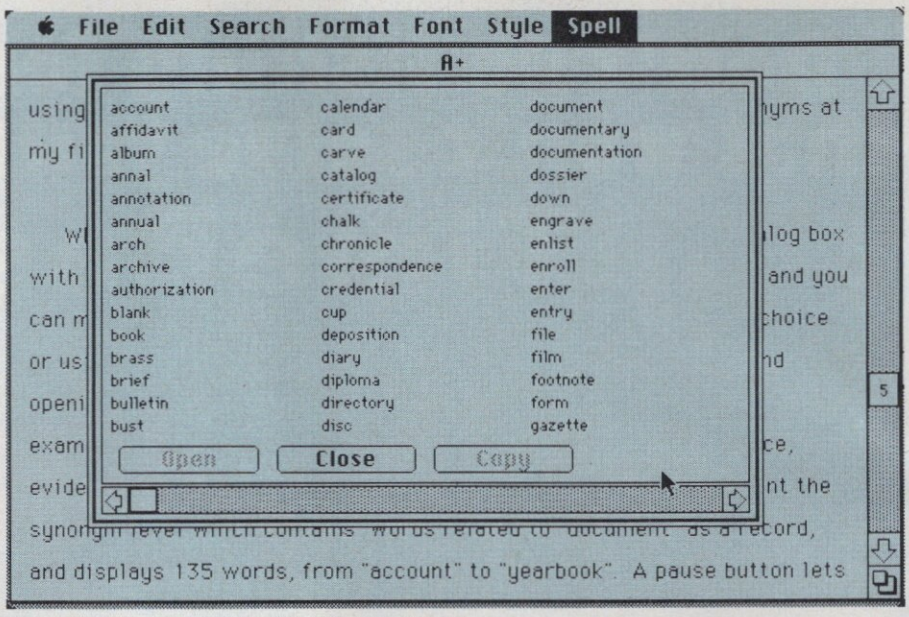

Figure 4: Partial listing of "synonyms" for document

Having an instantly accessible thesaurus demonstrates how computers can actually help you improve your writing. It makes something you might not bother to do so easy that now you'll do it. Those of us who wouldn't reach for a thesaurus might point and click for one. Whether you're looking for weird words or sibilant synonyms, a thesaurus can help you out.

Mac•Spell•Right takes up quite a bit of disk space, and Assimilation Process provides two versions in the package. One contains only the speller; the other contains both the speller and the thesaurus. The combined version requires a second disk drive. You can use the spelling program with a single-drive system if you create a stripped-down disk.

The company recommends removing the scrapbook and unnecessary fonts from the disk. If you have a single-drive system, you should ask your dealer, before you buy, exactly how much space you'll have left over for storing documents. Your dealer is also the person who can give you your free copy of Version 3.3 of MacWrite if you bring in your old MacWrite disk. ✚

UCSD PASCAL DOES IT AGAIN

The good news is now you can write your Apple™ applications in the language programmers love — choosing the development environment that works for your needs.

UCSD Pascal.® The Original, fully developed industry standard is now available in two versions designed specifically to run on the Apple™ Macintosh.™.

SofTech Microsystems makes it all possible by creating the best of all worlds — CHOICES. Depending on your needs, you have available the p-System development environment or the MAC development environment. Either system allows you to write and execute compiled, UCSD Pascal programs on the Macintosh without fuss or complications.

The p-System for the Macintosh offers UCSD Pascal, with extensions to interface with a set of popular Macintosh features, a useful set of development utilities, a full function screen editor and a file manager. If you're familiar with the p-System or Apple Pascal you'll feel right at home with this product. FORTRAN-77 is also available.

Our compilers generate compact code allowing you to write complex applications on the 128K MAC. Plus, our languages are truly integrated with the development environment.

Edit with ease. When an error is detected while compiling, the editor may be invoked and positioned at the statement in error.

For the first time, professional programmers now have available a full set of advanced development tools, **including a 68000 Assembler** and a symbolic debugger.

Want to run totally under the Mac environment? We provide a development system that does. It includes a mouse-based editor, a UCSD Pascal compiler, and program development utilities that operate totally in the Macintosh OS environment. Our UCSD Pascal compiler offers a compiled language that runs on a 128K machine. In addition, your applications can have a total Macintosh interface.

What does that mean to you? Access to virtually all Mac ROM routines. Overlapping windows. Pull-down menus. the Clipboard. Desk Accessories. And, of course, the mouse!

You'll find that UCSD Pascal goes MAC. And a lot of other places too.

Deeper into the Assembler

More introductory programming on the Macintosh

Last month I promised I would wrap up our look at a simple Mac assembly-language program in this month's column. Well, not quite. This month we'll put together the first portions of the code, examining them in depth; next month we'll finish up and take a quick look at the debugger. In future columns we'll examine some of the other languages popping up for the Macintosh, including some C compilers, MacForth, and another assembler.

Figure 1 illustrates the process we'll be using to create a final program from the miscellaneous files we're collecting. Note that we *must* create three files: the assembly source-code file, a linker-instruction file, and the resource file. We use the editor (EDIT) that accompanies the assembler to create all three of these files. For the simple program we're putting together, we'll perform each of these steps individually, but do note that the assembler includes an EXEC program that allows you to automate the process, once you've created all of your three source files (and a special EXEC instruction file).

Figure 2 is the assembly-language source code for the first part of our program (we'll look at the rest next month). I've separated the major sections of the code from each other with dashes. Within each line of dashes is a number that will serve as a section label in the following discussion.

In the beginning (section 1), we make sure to include the packed symbol tables for several predefined items. MacDefs.D contains basic system references, such as the location of global variables and other important memory locations within the Macintosh memory map. The primary information about the ROM routines that are callable from assembly language is included in HeapDefs.D, MacTraps.D, and ToolEqu.D.

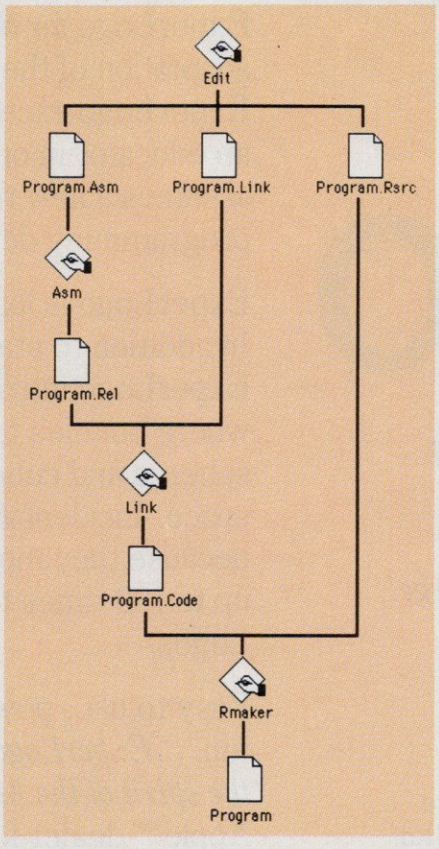

Figure 1: The assembly-language programming process. Note: this figure assumes you want to combine program code with resource information.

You can include the original source files that you used to generate the packed symbol files, but doing so lengthens the assembly process. You may even want to build your own Include file that has only routines you use in your programming, so you can provide names that are meaningful to you. For our purposes, however, the Apple-provided names and files are adequate.

Section 2 of the code begins the initialization process. Here we've performed the initialization calls for QuickDraw, the font manager, the window manager, the menu manager, and the dialog manager. *Inside Macintosh* describes many more resource managers, and, if we were using any of them (such as the text editor, named TEdit), we would be initializing them here, also. Note the Apple convention of preceding all ROM trap routines with an underline. They alert casual readers that these lines are something special.

In section 3 of the code, we open up our resource file for use. Normally, this routine is much longer (and coded slightly differently), but I've attempted to retain only the core of each routine so that you can see the required portion of each ROM routine use. The _OpenResFile routine, for instance, requires that the last stack item points to the name of the file to be used (thus the PEA 'A+' instruction). Note, however, that the

The Prodigy Comes Of Age!

ExperLogo *for the Macintosh*™ is a powerful adaptation of the Logo computer language. ExperLogo excells at Logo's traditional role as an educator in our homes and schools, while it assumes a new role as a powerful programming development tool.

ExperLogo is loaded with innovative features. In addition to standard Turtle graphics, ExperLogo introduces *Bunny Graphics*™ where bunnies frolic on the surfaces of spheres and cubes and race through 3-D space. Incidentally, we call them bunnies because they move incredibly fast, at speeds up to 100 times that of the turtle in other Logos.

Easy to use, powerful and most of all fun. . .*ExperLogo. . .a computer language in the spirit of the Macintosh!* Ask your local Apple™ dealer for a demonstration today.

_OpenResFile routine returns a value onto the stack, which we must take off before proceeding (the MOVE.W instruction does this for us). Normally, we'd examine the returned code and check for a valid result, but we'll keep our routine simple for now and ignore the returned code.

Notice that we didn't open our resource file until after we'd initialized the managers. The reason for this sequence is simple: You can't use any resources until the Finder knows where to get them.

Section 4 shows how to set up a simple menu. In this case, we're using menu 1, which is the default Apple menu. If our resource file contained specified menus, we could substitute the appropriate menu number in the second instruction. Menu creation is an area where novices often get confused when working with the Finder.

Certain resources have predefined default values. Some examples of default values in the Finder are the Apple menu (#1) and the Edit menu (#2). Since Apple reserves specific numbers for its own menus, the company suggests that developers begin their resource numbering at 256. That way Apple's defaults can change without affecting the developer's resources. For example, if Apple added a menu #3 default definition and we had assigned #3 as a menu definition in our resource file, we would have a conflict, and guess who'd win. (Hint: not us.)

Another thing to note in section 4 is that we cleared space on the stack (CLR.L -(SP)) to make room for a handle (see "Behind the Finder," *A+* November 1984, page 137) to be returned. This requirement is another hidden pitfall in assembly-language program development on the Macintosh. Remember, the Mac's ROM routines were designed for use with Pascal, so we must emulate what Pascal does in order to safely use the ROM routines. I highly recommend that all Mac programmers get a copy of the Lisa Pascal manuals, as they explain a lot of the quirks you'll find in the calling conventions for ROM routines.

Before we leave section 4 of our code, note also that you must first get a menu and then insert it into the Finder's menu list. Getting a menu does not make it ready for use, which is where careful reading of *Inside Macintosh* comes in. Make sure that you understand the relationships between the various routines described in each of the managers; Apple does not do a good job of describing order-dependent events.

Section 5 shows how to add the desktop accessories to the Apple menu. Here we assume that all accessories will have a DRVR file type, as do all those that Apple supplies.

Once our menu (or menus, if you define more than one) is done, you can draw the menu bar (see section 6). You may begin to get a feel for why the Macintosh takes so long before you get a new menu bar on the display after you double-click on a program name. Our simple program has only a few things to do before drawing a menu bar, but more complex programs often have large sections of code that must be executed before the program can draw that menu bar on the screen.

Section 7 initializes the event handler and shows the cursor on the display. We'll talk more about these steps next month, when we present the event handler itself.

Finally, we begin to get our dialog box. Since we numbered it 256, we must put that number on the stack before calling the GetNewDialog routine. Next month we'll display the dialog and create the routines to handle the mouse inputs. By the time we get that done, you'll have the operating core of a simple Mac program. You'll find that you can add to this core without having to change it significantly, a definite plus in Mac program development.

By the way, if you add an .End statement to the program code we've gone through so far, the program should assemble. Follow the process outlined in Figure 1 and create a usable(!?) Mac program that you can run through the debugger. You'll find that the Mac does a lot of work in those ROM routines! Of course, our program ends abruptly at this point, so you'll get the bomb message when you get to the end—but we'll fix that next time. ✚

COMMUNICATIONS/*BY GREG MAINIS*

DOW CLEMENT PHOTOGRAPHY

During the past several years, telecommunications has become an increasingly important aspect of computing. For hobbyists, communicating with other systems brings a new frontier of information and exploration, and this ability is essential for professionals. Until recently, Macintosh owners were unable to use their computer for this function, because of the lack of data-communications equipment for their Mac.

Now Macintosh users can also participate in the world of telecommunications. Microcom, Apple Computer, and Novation have released modems and terminal software that work with the Macintosh. Both Microcom and Novation manufacture a complete communications system that includes a 1200-bit-per-second (bps) modem and software. The Apple Modem, however, does not come with terminal software—you must purchase the MacTerminal software package separately.

MACMODEM

The Macmodem from Microcom is a 1200-bps modem that can transmit data at a rate of 110, 300, or 1200 bits per second and can be upgraded to 2400 bps. The unit is finished in the traditional Apple beige with olive trim (which matches the Macintosh's keys), and sports seven LED indicators on the front. These reception and data-transmission indicators, which the Apple and Novation modems lack, let you monitor operations. All three modems have a speaker that provides audio feedback so you can detect errors, busy signals, and the like, during the critical call-connection phase.

The Macmodem system comes complete with modem, software, and all necessary cabling. The package also includes one free hour on the Dow Jones News/Retrieval service.

Working with the Macmodem is a pleasure. The software is functional and well designed. A novice can pick up the manual and master the intricacies of this system in no time at all.

To begin communicating, you select the Macmodem icon or a previously defined icon to communicate with a specific source (see figure 1). After opening the Macmodem icon, you enter the communication window. In the usual Macintosh display window is a status line at the bottom of the screen. You can always tell ex-

Modems and software from Microcom, Apple, and Novation

Three Communications Systems *for the Mac*

actly what the Macmodem is doing. When you are connected to a remote computer, the system verifies if the call is connected; the clock keeps track of the elapsed time. Four indicators inform you of various conditions during file transfer. In addition, Microcom's software supports user-defined functions, and you can monitor them in their own status area.

To access a remote computer, simply select Dial Telephone from the Phone menu and enter the number. You can dial the number once or have the Macmodem redial it until a connection is made—

a nice feature when you are dialing a busy bulletin board.

Once you get a connection, the information that scrolls off the screen is saved in a buffer; you can view it at any time by using either the scroll boxes or arrow keys. Unfortunately, the program does not take advantage of the added memory of the 512K Macintosh. Therefore, information that exceeds the limits of the buffer is lost. You can elect to save all incoming data by activating Begin Receiving File on the Transfer menu, or you can send output to the printer whenever you want. You can access saved files with MacWrite for later use. As with all Macintosh software, the Cut and Paste features and the clipboard are available.

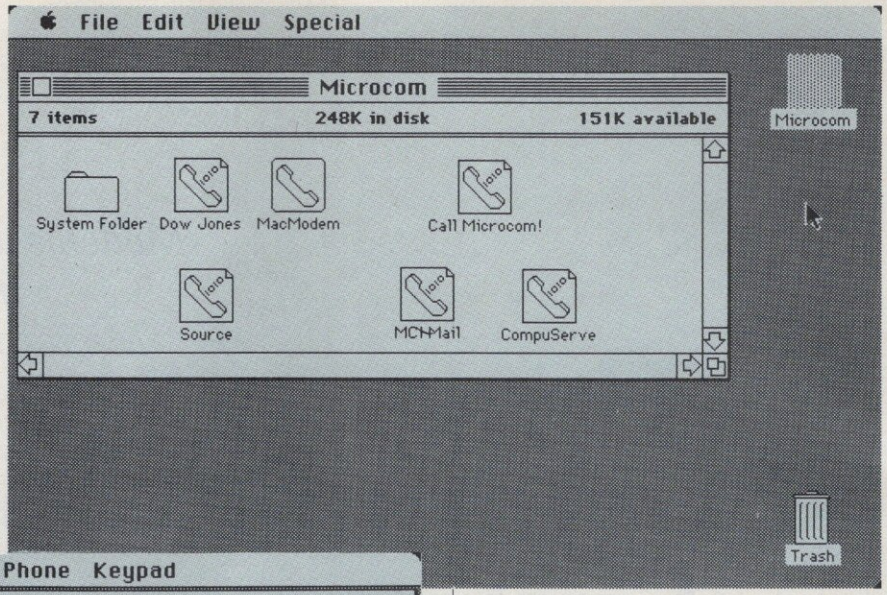

Figure 1: Microcom's Macmodem contains the necessary icons for communicating with other remote computers.

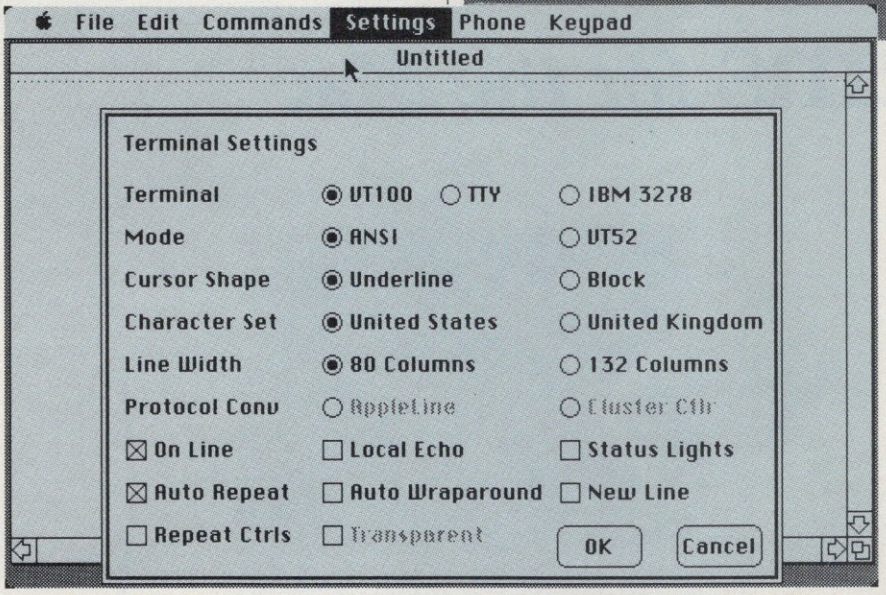

Figure 2: You use Communication Settings to configure different protocols for the Macmodem.

Terminal Configurations

A protocol is a method that computers use to exchange information in a predefined structure. They can let incompatible computers exchange information or help reduce errors in the transmission process. You can change the Macmodem default protocol by selecting Communication Settings from the Setup menu (see figure 2). This software package has a unique protocol feature that, Microcom claims, guarantees 100%-error-free communication. When you set the Transmission mode on Reliable, the modem attempts to use a special error-checking protocol that Microcom calls MNP, for Microcom Networking Protocol. The only disadvantage is that no large source computer uses the MNP. The company claims that Telenet and Uninet use this protocol (which would enable you to use MNP to communicate with The Source, for example). The Telenet service in my area does not use the protocol, however.

In addition to sending information to and receiving it from a large host computer, the Macmodem can communicate with other Macintoshes or other personal computers. You can transfer information as a text file (straight ASCII), as a formatted document (ASCII with control characters inserted by the application program), or as binary files (zeros and ones). You can also send all three kinds of information with MNP, for increased transmission reliability. If you run into trouble along the way, Microcom has a toll-free customer-support hot line to answer any questions.

Other Features

Other features include a one-year warranty, rotary or pulse dialing, auto-answer, screen clearing, flow control (XON/XOFF, line at a time, or none) and a user-defined mode that allows you to perform series of commands. The user function is particularly handy. You can program a series of functions to automatically answer a call and wait for a password before sending information.

No system is perfect, and Macmodem is no exception. Although the documentation is excellent, I could not find any information in the manual regarding the LED indicators on the front of the modem. Each LED is coded with an abbreviation (for example, DTR means data terminal ready), but the manual neglects to cover the topic.

I could not operate the Macmodem with other popular communications programs, but a company spokesperson said a modification to rectify this situation was available for $15. Software compatibility may be a problem if you are planning to buy other software packages to work with this product, however.

Probably the most annoying thing about the Macmodem is that it has no on/off switch. The technical-support people at Microcom told me that none of their modems had on/off switches and that I could leave the unit plugged in at all times.

TURN YOUR MACINTOSH™ INTO A MUSIC SYNTHESIZER FOR ONLY $89.95 WITH

MacMusic™

Thats right folks, MacMusic gives you the power to conduct that "four piece band" living in your Macintosh computer. hat "four piece band"? I'm refering, of course, to the Macintosh's internal waveform oriented, four voice synthesizer. It has een waiting to show off its versitility and now, with MacMusic, YOU have the power to let it do its thing!

MacMusic allows you to compose and edit songs and then play them through either the Mac's speaker or its sound port in e back. The editor allows you to easily insert, delete, or change notes without difficulty, using the mouse. It also gives you e ability to generate subroutines that can be played as many times in the song as you like. Additionally, you are allowed to ange the time, key, volume, and instrument of each voice at any time during the song.

The instruments making the sound for each voice can be designed by YOU with MacMusic's sophisticated waveform ditor. You simply add or subtract harmonics of varying amplitude to your wave until you are satisfied with the instruments ound. And if your not sure you know how to do that, then don't despair, just tinker with the thing until it sounds the way YOU e it. And with MacMusic's 16 instruments, you'll have a great time experimenting.

So, if you want to be the conductor of your own "four piece band," don't wait till tomorrow, run out and buy MacMusic day!!!!

If you decide to keep the software, the entire rental fee is deducted from the purchase price. VIP MEMBERS GET A FULL 28 DAYS for just $30 above the V.I.P. base fee. This also includes the game library privileges for a $5 combination savings.**

9 OPTIONAL GAME SOFTWARE RENTAL LIBRARY—The Game Rental library is available to members for just $10 PER YEAR and permits evaluation (or just enjoyment) of any game or educational software product as above.

10 SPECIAL SAVINGS BULLETINS—THE PRINTOUT—The NETWORK seeks every opportunity to save money for its members. We buy excess dealer inventories, and store bankruptcy closeouts regularly. We then turn around and make this merchandise (only top quality name brand products) available to our members at fantastic savings via THE PRINTOUT, our newsletter and savings bulletins.

11 DISCOUNT BOOK LIBRARY—Working with numerous publishers and distributors, The NETWORK has assembled a library of over 1000 computer related books and manuals at savings of up to 75% from the normal store price.

12 MEMBERSHIP REFERRAL BONUS—Our most valuable source of new members is you! To date almost 40% of our members have been referred by word of mouth from other satisfied members. For those of you who refer new members, The NETWORK will credit a cash bonus to your account applicable to any future purchase.

13 CORPORATE ACCOUNT PROGRAM—Almost 50% of The NETWORK's members are corporate buyers and users *(see opposite page left).* The NETWORK can establish open account status and assign designated account managers to expedite orders, and coordinate multiple location shipments.

14 QUANTITY DISCOUNTS—For large corporations, clubs, and repeat or quantity buyers The NETWORK can extend additional single order discounts, when available to us from our manufacturers and distributors.

15 PRICE PROTECTION—The PC Industry is crazy!! Prices change not yearly or monthly or even weekly but often day by day! These changes are sometimes up *but are mostly down!!!* **THE NETWORK GUARANTEES THAT IN THE EVENT OF A PRODUCT PRICE REDUCTION, BETWEEN THE TIME YOU PLACE YOUR ORDER AND THE TIME THE PRODUCT SHIPS YOU WILL ONLY PAY THE LOWER AMOUNT!!**

APPLE MODEM/MACTERMINAL

The Apple Modem from Apple Computer, Inc. is available in either a 300- or a 1200-bps version. Both models are physically identical and simple to install, and they come with all the necessary equipment to connect your modem to the computer and telephone. To install the unit, just plug in the appropriate cables and switch it on. The 1200-bps version is capable of transferring information from at 0–300 bps in the low-speed mode and 1200 bps in the high-speed mode. You can control the modem with keyboard commands.

MacTerminal is a versatile, easy-to-use communications program that drives the Apple Modem. With it, you can access an information utility or bulletin board or emulate popular computers or terminals. The program includes discounts on The Source, Dow Jones News/Retrieval Service, CompuServe, EasyLink, and MCI Mail.

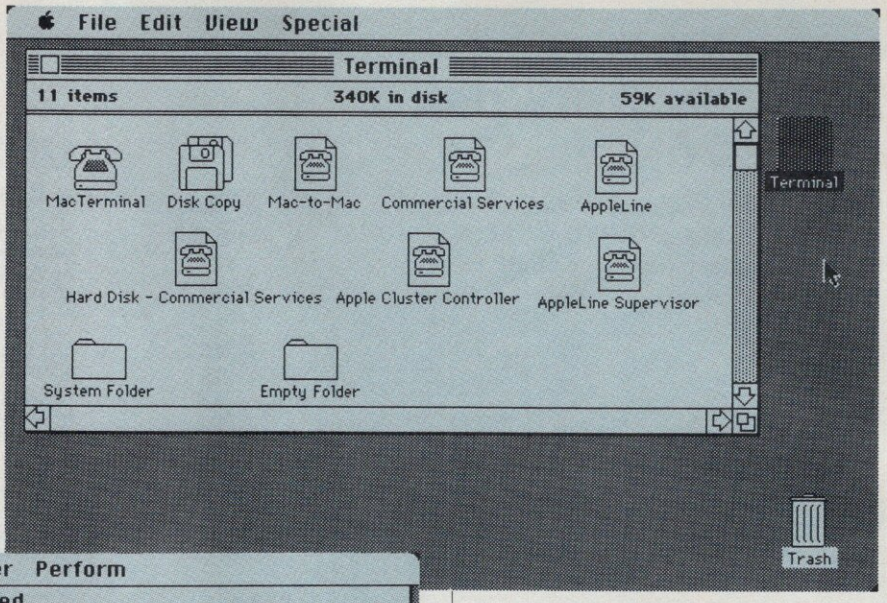

Figure 3: MacTerminal allows you to choose various communications methods.

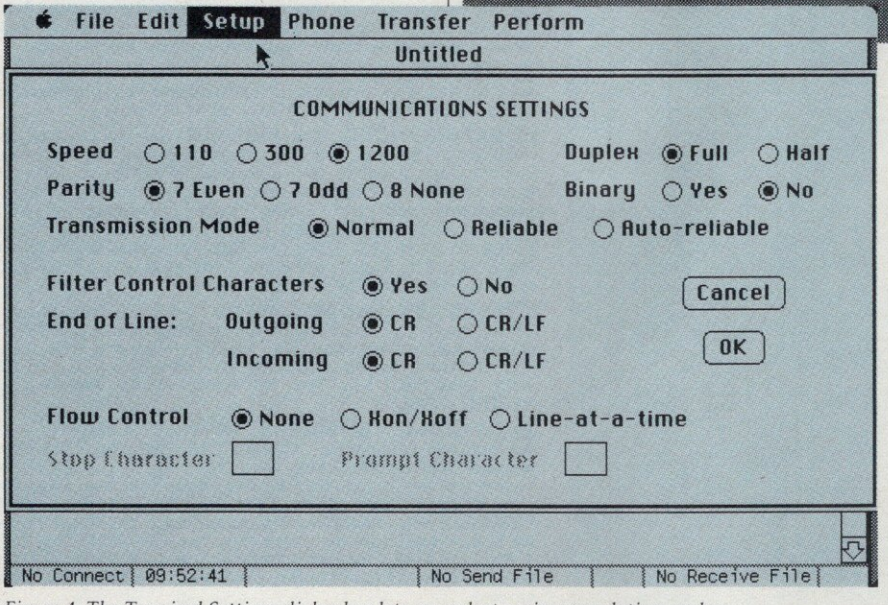

Figure 4: The Terminal Settings dialog box lets you select various emulation modes.

Dialing

To start using MacTerminal, open its icon or use a previously saved file (see figure 3). The main menu contains simple, straightforward commands for quick, easy access. The default settings let you communicate with most remote computers without any modifications to the telecommunications settings.

To begin a call, select Phone Settings from the Phone menu. After you have entered the phone number and selected the telephone type (tone, pulse, or mixed), you are ready to dial. MacTerminal makes you go back into the Phone menu again and select Dial to begin the call. It becomes awkward to enter the number in one submenu and actually dial in another. If the line is busy, Apple Modem requires manual disconnection; it has no provision for automatic redialing. In addition, you'll notice a considerable time delay when you cancel a call.

Instead of using a visual status indicator (LED or status line) to inform you of the current carrier status, MacTerminal displays a dialog box indicating that a connection has been established. MacTerminal lets you use the scroll bar to scan more than one screen full of information. As the screen scrolls, you can let the information roll off the top of the screen without saving it, or save the information to disk. I found that recording the lines off the top was useful, since using that method, I could review my entire communications session.

After the call, you can save the data to the disk and later use MacWrite to access it. Once you no longer need the information you have sent, you can reset the screen. Doing so erases all previous data and returns the communications settings to their default configurations. MacTerminal does not allow you simply to erase previous data. Therefore, to clear the screen, you must reset and reconfigure the system before dialing another number.

Printing

MacTerminal gives you the option of printing data from the screen to the printer. You use Select All from the Edit menu and then print or highlight selected portions. The program has no provision for sending incoming data directly to a printer.

A major strength of MacTerminal is its ability to emulate a TTY (Teletype) terminal and two popular minicomputers, the Digital Equipment Corporation VT-100 and the IBM 3278. The Terminal Settings dialog box displays the various emulation settings available with this program (see figure 4). The VT-100 setting allows you to use either the ANSI or the VT-52 mode to control the screen output. The IBM 3278 setting works with AppleLine to communicate with IBM mainframes or

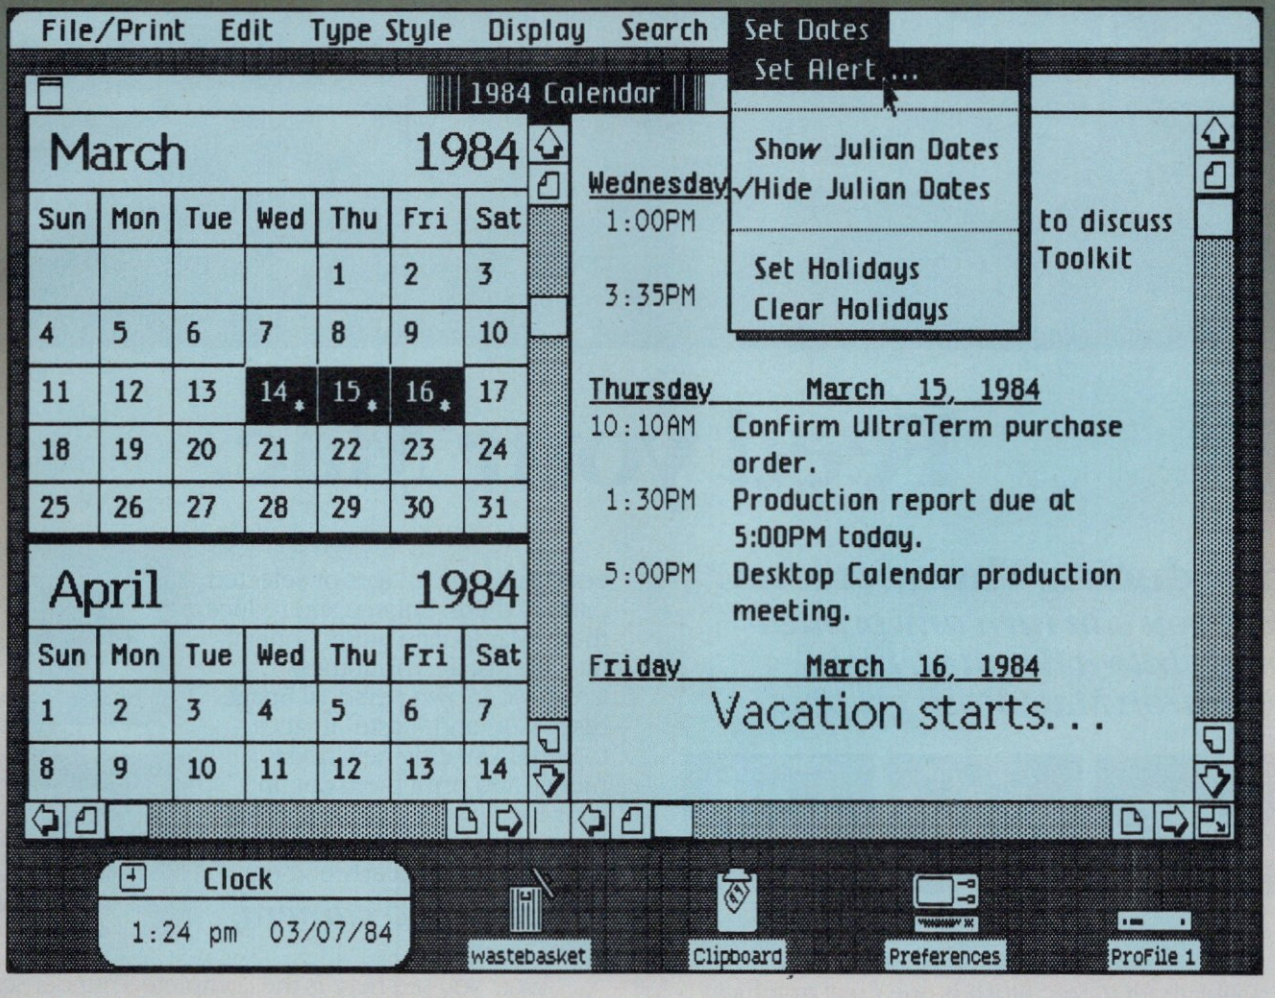
INTRODUCING



Desktop Calendar for your Lisa 2

Desktop Calendar, a new tool for the Lisa 2, will improve the way you work because it helps you manage your time.

Your're an important person. Working hard to get the job done. But what happens if you get so involved in your work that you lose track of time? Missing an important appointment or meeting can mean disaster.

If you put the times and dates of all your important appointments and meetings into Desktop Calendar, it will automatically remind you of them in time for you to meet your commitments. Once you place Desktop Calendar on your electronic desktop, you can use your computer to write a letter, recalculate a schedule, prepare a financial statement, or use any of the Lisa Office System Tools. At the proper time Desktop Calendar will interrupt, reminding you of your appointment.

Talking on the phone to an important client? Want to know all the dealings you've had with them for the last three months? Desktop Calendar will search through its electronic notebook and tell you. Want to know the address of an important business contact named 'JONES'? Desktop Calendar will tell you that too.

Desktop Calendar is more than just a calendar for your computer. It will also keep track of appointments, hold addresses for easy reference and remind you of important events, even when you are busy working with another tool in the Lisa Office System.

Desktop Calendar will be available third quarter 1984 from Videx.

Feed your Mac.

Introducing ThunderScan.™

Now you can turn any printed image into a detailed, high-resolution Macintosh graphic.

Just roll your original into your Imagewriter.

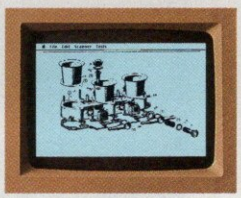
ThunderScan scans and digitizes the image.

Presto! A high-resolution MacPaint document.

No doubt about it, Macintosh is one great graphics machine. But until now, Mac graphics have been limited to what you can draw with a mouse and what someone else has put on a disk. Consequently, taking full advantage of Mac's graphics capabilities has been tough. But now there's ThunderScan. The new optical scanning device that lets you feed your Mac a steady diet of graphics that are useful to you.

ThunderScan turns Mac's Imagewriter printer into an image reader. So you can digitize any printed image and turn it into a detailed, high-resolution MacPaint document. Anything, including forms, half-tones, photos, mechanical drawings, maps, floorplans, logos, signatures and more. From black and white and color originals. ThunderScan reproduces them at over 200 dots per inch and in 32 shades of gray.

ThunderScan's application software, written by Mac-team-member, Andy Hertzfeld, makes it an extremely versatile and useful tool. You can generate full-page images or selected parts of them. Enlarge and reduce them. Manipulate them. Control the contrast and brightness. Create your own personal image disk. "Cut" and "paste" images together, creating new documents. And print them out on your Imagewriter. Or send them by modem to another Mac. The possibilities are nearly endless.



No lights, no camera, just action.

What you see here is the complete ThunderScan system. You don't have to buy an expensive video camera. Just pop out your Imagewriter's ribbon cartridge, snap in ThunderScan and you're set. It can even work in the dark (maybe you can think of an application for that).

If you bought a Mac at least partly for its graphics, only to find you couldn't take full advantage of them, now you can. With ThunderScan.

At an introductory price of just $229, it's a small price to pay for a whole new graphics capability.

For more information or a ThunderScan of your own, see your dealer or call us today.

Move Into MacStation™!

It's two walls and a roof where every Macintosh should live.

With plenty of storage space for a printer, disk drive, modem and manuals.

And a place your pet mouse can hide!

It's MacStation. An integrated workstation that's at home in offices, dorm rooms or dens. And a terrific way to save valuable desk-top real estate.

Adjustable shelves let you rearrange the rooms the way you like.

The roof doubles as a handy printer stand. With attic space to store continuous form paper.

Plus MacStation is ventilated. To keep Macintosh cool. And with the large front door, you can easily take Mac out for a walk.

You don't have to mortgage your house to buy one, either. Because you can get MacStation for only $95* at your favorite Apple store.

Give your Macintosh a good home!

with the Apple Cluster Controller.

The Keypad menu is a mouse-driven keypad that emulates certain keys on the VT-100 or the IBM 3278. The keypad layout is determined by your choice of a terminal for emulation from the Terminal Settings menu. This feature gives you added editing capabilities.

File Transfer

To further configure your system for sending and receiving data, you can use MacTerminal's file-transfer settings. The program has two data-transfer methods, XModem and Text. XModem is another error-checking protocol. This function allows you to send and receive data (e.g., MacPaint documents, Mac fonts, and the like) without error. The Text transfer method is for sending and receiving data as ASCII characters. If you are sending data to a computer with slower communications capabilities, MacTerminal lets you set a delay between characters and/or lines, which helps you avoid data overrun to the remote computer.

The Apple Modem and the MacTerminal program come with a 90-day warranty. After using both the 300- and 1200-bps modems, I suggest that it's worth the extra money to purchase the 1200-bps version.

CAT COMMUNICATION SYSTEM

The Cat system from Novation is another complete communications package. The Smart Cat-Plus modem transmits data at the speed of 1200 bps. The on/off switch is placed conveniently in the front of the sleek, gray case, next to the ready and power lights. In the absence of LED indicators to show the current condition of the system, Smart Cat has a ready light that flashes as data is being exchanged. The system provides keyboard commands for controlling the modem.

The system comes with all necessary equipment, as well as a free subscription to the *Official Airline Guide* and an introductory demonstration of CompuServe.

Corvus OmniDrive™ gives you unlimited file capacity.*

Add a Corvus OmniDrive to your Macintosh™ and unleash the full potential of this amazing new Apple computer.

More Capacity. Take file capacity for example. Put the Macintosh Finder program to work with the vastly increased storage capacity of a Corvus OmniDrive. Now you can set up many more volumes with 128 Macintosh files in each one. Need more capacity? Add another OmniDrive, then another, and another, up to a total of eight. Total capacity using 45 MB OmniDrives is 14,336 files.

Faster. OmniDrive is faster too—50% faster than competitive hard disks, three-times faster than the Mac Floppy.

Mac Compatible. We didn't modify the Mac operating system, we work with it. You don't sacrifice any of Mac's famed user friendliness.

Network Ready. With OmniDrive, you're all set to expand to a network. As your business grows and you need more computers, don't hesitate. OmniDrive is network ready, ready to connect more than 60 Macs on the Corvus Omninet network, the world's most widely used network for personal computers.

Full Service and Support. Corvus is the world's most experienced supplier of Winchester disks and pc networks. We have delivered over 35,000 hard disks and connected more than 115,000 computers on 14,000 Corvus networks worldwide. We provide the kind of support and service that assures protection for your investment now and in the future.

Lowest Cost. The best news of all is the price: $1,795 for the 5.5 MB model. That's less than the competition, and most can't touch the capacity, versatility, or performance that Corvus offers.

Get a Demonstration. Contact your nearest Corvus or Apple dealer today. Ask for a free demonstration of the Corvus OmniDrive and find out how much better your Macintosh can be.

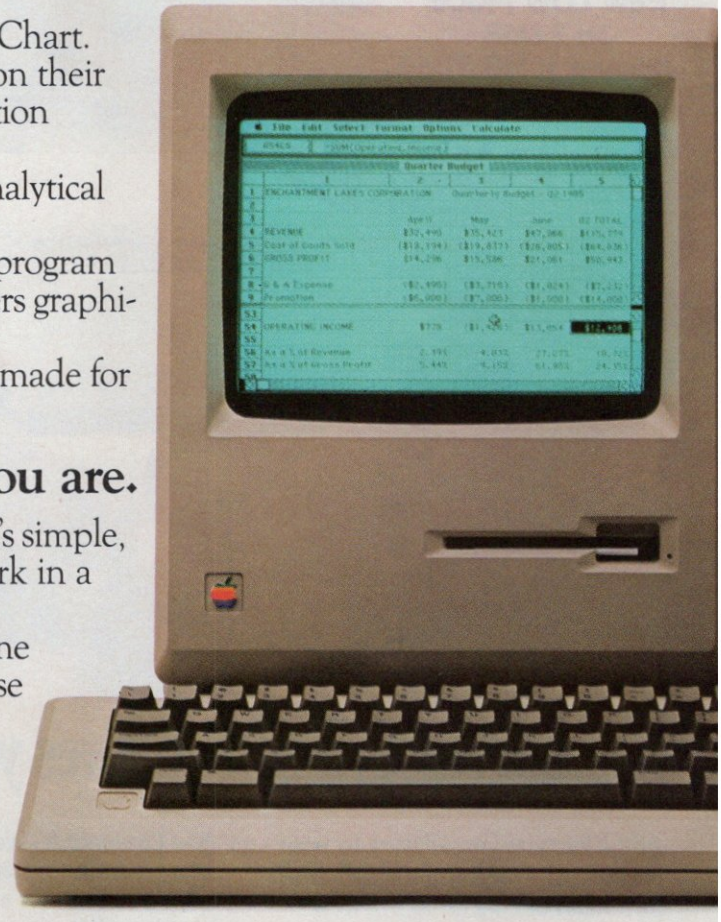
The one, a spreadsheet of dazzling analytical power and graceful simplicity.

The other, a picture perfect charting program that makes rows and columns of numbers graphically clear.

And the beauty is, they were literally made for each other. And for Macintosh.



Multiplan accepts you as you are.

Multiplan takes full advantage of Mac's simple, intuitive operating style. So you can work in a way that will come natural to you.

You don't have to memorize any arcane commands. Just point and click the mouse to move mountains of figures and formulas quickly and painlessly.

In addition, Multiplan gives you features that make hard copies gratifyingly readable. For instance, the enviable ability to print sideways.

So you can't run out of column room. No matter how wide your spreadsheet gets.

Chart makes people see what you mean.

Microsoft Chart gives you lots of ammunition for your arguments: Pie charts, bar charts, line, column, area and scatter charts. Or combinations.

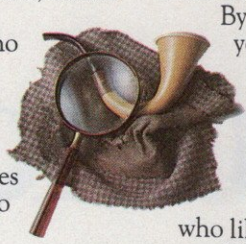
Introducing Typing Intrigue.™

Now there's hope even for executives hardened by years of typophobia, arcade-shocked junior high school students, and anyone else who needs to get all ten fingers working together, at last.



Typing Intrigue takes the drudgery out of improving your typing skills. It makes learning to type enjoyable, so you'll stay with it. And that makes it really *effective*.

Like a truly professional teacher, Typing Intrigue adjusts itself to your level. It recognizes you (and up to 5 other "pupils") and designs its lessons accordingly, recording your progress from session to session. It's never repetitive, never boring, and keeps you motivated.

As your skill improves, you earn clues toward solving *The Case of the Missing Bathtub.* Where might one hide a £50,000 onyx and gold antique tub? And why? How are Reginald Chumley and Lady Deirdre Dunsmire involved? Where did the worn elbow-patches come from? Do those rumors about Lord Southby mean anything?

By the time these characters help you break the case, you'll be typing at breakneck speed.

You can also improve your typing skill with a second game option—*Rain*—a fast-moving, arcade-type challenge for those who like more action.

Of course, you don't have to brave a thunderstorm or get involved with Inspector Hargreaves' puzzling bathtub case if you choose to just roar through the typing exercises undiverted. But who can resist a good thriller?

Contact your Macintosh™ dealer, or call 1 800 MACWARE to find out where you can get Typing Intrigue.

accompanies the system is called Mite and was developed for Novation by Mycroft Labs, Inc. After opening the Mite icon or a previously saved file, you will find that this software breaks the Macintosh tradition. Instead of using the mouse and pull-down menus, Mite uses conventional menus and keyboard controls common on other personal computers (see figure 5).

Evidently the system was developed for a standard computer and was transferred to the Macintosh without modification. This approach becomes apparent when you start reading the manual. As you thumb through it, you see pictures and explanations that describe how to operate the system with an IBM Personal Computer. Even though Mite doesn't use Macintosh technology, it is still a powerful data-communications tool.

A status line at the top of the screen describes the current condition of the system, and help screens appear throughout the program.

Dialing

To start a communications session, enter the phone number on the Parameter submenu (see figure 6). Since Mite is not mouse-driven, you must enter P (Parameter menu) and N (phone number) from the keyboard.

This submenu provides several options. You can select the number of times the Cat modem will redial a number, and you can set the modem to automatically answer incoming calls and request a password.

You go back to the main menu to activate the modem. When the connection is completed, you can use various options in different submenus and return to the main menu to finish the call, all without disconnecting the remote computer.

Data Transfer

Mite offers myriad ways to send and receive data. The Binary File Transfer submenu gives you a choice of several different proprietary protocols. In addition, you can choose a more typical protocol, such as Xmodem, Text, or Macintosh to Macintosh (see figure 7).

Here is where the manual comes up short. The documentation briefly explains most of the available op-

tions, but I could not find any material on the Macintosh-to-Macintosh transfer. The on-screen Help menu gives a brief description of Mac-to-Mac transfer, however.

Mite can also send files to or receive them from a large source computer, using its Text File Upload and Text File Download options. As a file is being received, the status line on the main menu records the amount of data that has been captured. The system has 62K of space available to store incoming data—this version of the software does not take advantage of the 512K Mac.

After file capture, you must leave the main menu and return to the Mite desktop icon to print the file. During the short time I had to test this product, I could not get MacWrite to accept a file that had been retrieved by Text File Download. In all fairness, however, I should say that I was unable to contact Novation to inquire about this matter.

Other features include a choice of rotary or pulse dialing and a user-defined mode. Micro String Definition is one such mode, and it allows you to perform a series of commands—an automatic log-on procedure, for example.

The Smart Cat-Plus comes with a one-year warranty and is fully compatible with MacTerminal. I have dealt with Novation in the past and have found that it stands behind its products to the fullest extent.

RECOMMENDATIONS

Microcom's Macmodem is a well-designed product. I have no doubt that the Macmodem would be a fine addition to my Macintosh. The documentation is comprehensive and well written. The overall strengths of this package rest with its ease of use, status-line indicators, auto-redial/answer features, and the user-defined functions.

The only question I can raise about this product has to do with software-compatiblity problems—but you may not need other software with the Macmodem. Don't overlook this package when you are shopping for a complete communications system.

The Apple Modem and MacTerminal combination gives you the "plain vanilla" system—you won't ever have to worry about future compatibility problems. This system is easy to use and provides emulation capabilities that other packages lack. If you need to emulate the VT-100 or IBM 3278, then this is the system for you. I hope that future versions of MacTerminal will come with a redial feature, though.

The Cat Communication System from Novation could be an excellent combination—the package is sophisticated, and the hardware is versatile. If you are buying this package as a total system, however, I recommend that you wait until the manual and the Mite software have been revised specifically for the Macintosh.

If you are thinking of adding another terminal program to this system, the Smart Cat-Plus and MacTerminal would make a very good combination. Since the Apple Modem and Smart Cat-Plus are compatible with most popular communications programs, you won't have to worry about software compatibility with future products.

Considering Novation's reputation for excellent product support, I would seriously think about combining the Smart Cat-Plus modem with a communications program other than Mite for the time being. ✚

STAR LEAGUE™ BASEBALL
Actual Atari® screens—Other versions may vary.

"Rather than adapt and duplicate the same old ballgame, (Gamestar has) made some bold changes. This not only gives its contest heightened playability, but also reassures the public there are still more programmers with originality.

"The first change is in player perspective. In Gamestar's rendition, we're all the way up in the right field bleachers, and wait until you see the action from here. With the pitcher now throwing right to left in 3-D fashion, we can watch the ball (and its shadow) dip and dance at the batter. When contact is made, the ball moves realistically, either bouncing through the infield or sailing with convincing flight toward the warning track.

"The second innovation will become obvious after the ball is hit. The players automatically spring into action. You control their subsequent moves and throws, (which) forces the offense to rely on strategy and skill, rather than on an inexperienced opponent scrambling to activate the correct fielder.

"The game also incorporates other special features to insure a major league quality. You can choose from different line-ups, planning your game around the single hitters or the big boomers. There are different pitchers to start, with a reliever patiently waiting in the bullpen. A lively organist keeps the screaming fans happy while you play against an opponent or computer in a full nine-inning game or simple batting practice."

Suggestions from our readers

Quick Start

When you copy files or change disks, the Mac operating system often requires that you reinsert the start-up (system) disk. This frustrating experience is familiar to users of two-drive Macs, as well as to single-drive-Mac users. Some software won't run unless it is on the start-up disk. Apple suggests changing the start-up disk by double-clicking an application on the "new" disk and immediately exiting. This causes the new disk's scrapbook, notepad, and desk accessories to become active, but it is inconvenient and time-consuming.

There's a much easier way. Just run the Finder on the disk that you want to designate as the start-up disk. You say you've tried that, but you get the dialog box that tells you that an application cannot be found? Here's the trick: Apple included a little-publicized feature in the Finder that lets it try to run any file. It was originally supposed to let Lisa developers transfer a special program from the Lisa to the Mac. To run this program, you hold down the ⌘ and Option keys while double-clicking on the program icon, and you can run the Finder the same way. If you insert a "new" disk and want it to become the start-up disk, double-click on the Finder on the "new" disk, while holding down the ⌘ and Option keys.

MacRuler

I have a tip for MacPaint users who need to have structured, measured drawings. If you are making a drawing freehand and need to have straight lines, you use a ruler. MacPaint lacks a ruler, however, and provides a "straight line" tool, instead. If you need to draw lines of specific lengths, you normally use the inch marks on a ruler, but MacPaint's straight line has no length calibrations. You could "select" the line in question and duplicate it elsewhere in the drawing, but this approach is awkward. There is a better way.

Choose the Grid option from the Goodies menu and use a pattern with dots spaced widely apart (see figure 1). The Grid option forces all lines drawn on the screen to begin and terminate at fixed locations, based on a grid superimposed over the drawing. Although the grid itself is invisible, if you choose the spaced-dot pattern from the available patterns, the dots will represent the grid points on the screen. With this method, you can easily draw lines of specific lengths, and you can use the dots like the inch marks on a conventional ruler for measuring lines.

Alphabetical Golfers

My father, who is retired and coordinates golfing activities for senior citizens in northwestern Washington state, recently obtained a Macintosh.

He wanted the Macintosh to arrange the names of senior golfers in alphabetical order, but neither the Macintosh nor the MacWrite manual explains how to alphabetize.

After some trial and error, we settled on the following method:

1. View the desktop by icons.
2. Make a copy of an empty folder.
3. Rename the copy of the empty folder (for instance, Name List).

Figure 1: Use a spaced-dot pattern from the available patterns to draw a grid representing inch marks on a conventional ruler.

4. Give any icon the name of a senior golfer. Perhaps the quickest way is to make a copy of an empty folder and rename it with a golfer's name.
5. Drag each icon that is named after a senior golfer into the Name List folder.
6. Open the Name List folder.
7. View the contents of the Name List folder *by name*. The names of the senior golfers should be listed in alphabetical order.
8. To obtain a printout of the contents of the Name List folder in alphabetical order, reduce the size of the window so that it shows only the contents you want printed. Print as instructed on page 72 or 73 of the Macintosh manual.

If you want to add some new names, create more icons and drag them into the Name List folder.

If you want to delete some names, drag their icons into the trash.

Special MacTerminal Keys

I have discovered a few "undocumented features" on MacTerminal that people may not be aware of. Several commands let you move the cursor's position on the screen while you're on-line.

- ⌘H backspaces the cursor one space
- ⌘I moves the cursor to the right to the next tab marker
- ⌘J drops the cursor down one line
- ⌘K drops the cursor down two lines
- ⌘M moves the cursor back to the start of the line

Additionally, the ⌘ G causes the tone to sound. Pressing the Option key changes the cursor to a special shape with four arrows. Then, while you hold the Option key down, you can move that cursor to any position on the screen by using the mouse. A single click of the mouse brings the active position of the cursor to that spot for further typing.

I had some trouble using these commands and the Option-key cursor placement while I was actively on-line. After signing off, I was able to do some limited text editing using these commands, however.

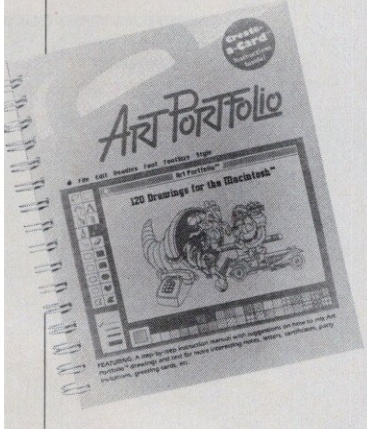
Creative Inspiration

Five inspiring new programs for your Macintosh™ from Axlon. You'll find these programs at better Apple dealers right now. (Or any day now.)

One

Art Portfolio™
$59.95

A diskfull of art spots and a book full of ideas on how to use them. If you like to MacPaint;™ if you know how to take advantage of good ideas to unleash your creativity, Axlon's Art Portfolio is for you. It includes really beautiful art spots, much better than anything else available. And the images are exactly the right size for you to use in your letters and cards. Create-a-Card instructions are included to give you ideas about making your own greeting cards.



Two

The Card Shoppe™
$59.95

Here's everything you and your MacPaint program need to get into the card-making business.

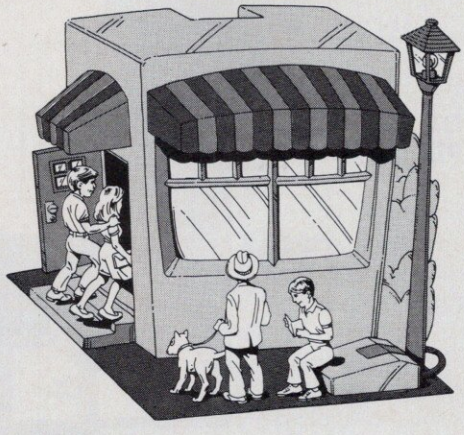
► Special drawings, ranging from the obvious to the obscure.

► A complete, exhuberant calendar of holidays and greeting card occasions, if you need one to create a card.

► A see-through formatting overlay for your Mac screen that lets you position your art and words before you print, so you know it will fit properly on your card when folded.

► Samples of paper and envelopes for your ImageWriter.

Best of all, The Card Shoppe gives you a ton of creative ideas for your own special cards for your own special purposes.



Three

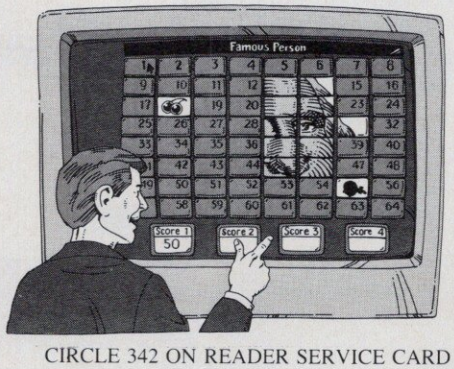
MacMatch™
$49.95

This is one of the first of a new breed: Native Macintosh games. Our software gamemakers have taken their inspiration from the tv game show, Concentration,™ and have built it on the Mac's quickness and graphics power. When you match two squares, you get clues about the hidden puzzle. It comes with puzzles, but the real beauty is that you can make up your own, as complex or simple as you like. You'll never get bored. And think what party puzzles might look like...

Four

MouseTracks™
$49.95

We put Mac's considerable graphics skills through the loops to develop an eye-popper for Mac's first mouse game.



You will zoom an animated mouse through a maze-like environment avoiding a bad kitty cat intent on supper. There are plenty of perils and rewards for the skillful. MouseTracks shows everyone how much fun Macintosh can be.

Five

Typing Avalanche™
$59.95

Since man does not live on art alone, but by lots of words that flow from the mouth of Mac, we've commissioned the first typing strategy program for the Mac. It's aimed at the poor duck who somehow got through school without learning touch typing. (The rest of us, in other words.) It's fast paced. It's fun. And it works. Play it a while, and you'll suddenly realize you are a touch typist. Someday the schools will catch up.

New from Axlon. Now at your Apple Computer Dealer.

▸ TWO STAND-ALONE VERSIONS OF FORECAST

Monogram has released two versions—one for Apple II and another for Macintosh computers—of its tax-planning program Forecast. The program can be used either on its own or in conjunction with the company's financial-management program Dollars and Sense.

Forecast can combine a current year's tax data with tax scenarios for the next four years, thus enabling users to perform "what if" tax modeling with their personal-finance programs. The software incorporates the essential components of Form 1040, Schedules A, B, C, D, G, and W, and enables users to estimate federal taxes using either Schedules XYZ, Income Averaging, or the Alternative Minimum Tax.

The Macintosh version of Forecast uses multiple windows, pull-down menus, icons, and dialog and scroll boxes; the Apple II version comes with a 64K RAM version on side 1 and a 128K RAM version on side 2. *(List Price: Macintosh version, $69.95; Apple II version, $59.95)*

MACTYPE FROM PALANTIR. THE TYPING TUTOR THAT IS

F

FIRST

Palantir knows that if your Macintosh™ is to be fruitful, you must first conquer the keyboard. And for many, that means learning how to type. So, Palantir created MacType. It's the first typing tutor for the Macintosh to put to use benefits of proven teaching techniques that speed up learning. Simply, MacType uses mental patterning to reinforce manual exercises. It teaches your fingers and your brain rather than your eyes, and you learn more quickly. If one of your first tasks on the Macintosh is to learn how to type, think of MacType first.

A

ADVANCED

Palantir designed MacType to be the most advanced typing tutor for the Macintosh that is available today. MacType takes full advantage of Macintosh's flexible screen displays and the simple functioning of its mouse to teach you how to type. All the know-how that has gone into the most complex Palantir Software was used in the development of MacType. You're getting state-of-the-art technology even in this basic program. It takes advanced skill to create a fundamental program that is both fun and mental for the user. And you get MacType's advanced features at a price that is very competitive.

S

SIMPLE

Palantir has also designed MacType so that it is amazingly simple to learn and use. Because of the teaching principles inherent in the program, you will get up to an effective typing speed in a very short time. You can also use the skills you learn on MacType to operate any typewriter keyboard, not just the Macintosh. Compared to the other typing tutors, MacType will actually let you enjoy learning. You may like it so much that even after you've mastered its touch-typing technique, you'll go back to the MacType exercises to sharpen your skills and increase speed. MacType shows that working smart can be working simple.

T

TESTED

Palantir thoroughly tested MacType to insure that it will work for you. With it you will learn to type fast. MacType should be your first choice. It is based on advanced programming technology and is still simple to learn. MacType is another quality, "No Bull" product from Palantir. If you want to learn more, contact

Powerful database management for Apple's whole family.

Three powerful, upgradeable database programs—each with mail merge—take you from file management to a sophisticated relational/hierarchical system.

OMNIS™ 1, OMNIS 2, and OMNIS 3. The new family of database software that grows with you—no matter which Apple computer you use. From basic file management to sophisticated information management. From applications development through comprehensive database management.

The OMNIS trio offers more power, more features than other leading database packages costing more. Each OMNIS program is upward compatible. And each is easily upgradeable—you pay only the difference in program cost plus a handling charge.

OMNIS 1, OMNIS 2, and OMNIS 3 are available for the Apple™ II Plus, IIc, IIe, III, IBM™ PC, IBM XT, DEC™ Rainbow, Victor/Sirius,™ Sage,™ and Apricot™ microcomputers. OMNIS 2 and OMNIS 3 are also available for Macintosh™ and Lisa™.

OMNIS® 1 **The File Manager.** An easy-to-use entry level product with HELP screens. Ideal system for a variety of file management tasks. Full calculation capability. Comprehensive report facility with standard, built-in letter/mail merge. Upward file and data compatible with OMNIS 2 and 3.

OMNIS® 2 **The Information Manager.** A sophisticated information management system. Capable of advanced error checking on data entry via a wide range of logical functions and operators. Multiple update and delete facilities. Upward file and data compatible with OMNIS 3. Supports hard disk systems and multi-user operation on local area networks.

OMNIS® 3 **The Database Manager.** A complete database management system. Supports up to 12 open files at any time. Operates as a relational or hierarchical database system. Flexible screen and report formatting and user-defined entry sequences allow screen overlays, custom messages, and menus. Can generate complete turnkey systems. Supports hard disk systems and multi-user operation on local area networks.

▸ SMT INDUSTRIAL CONTROL SYSTEMS

Systems Manufacturing Technology (SMT) has released five remote-control modules that allow you to use Apple II computers for industrial-data-collection and home-environmental applications. Adtech is a remote analog-to-digital converter module that can read up to ten analog inputs. Datech is a digital-to-analog converter that provides two analog outputs and six binary TTL outputs for control of external devices. Tritech, an AC and DC relay card, enables you to control up to four AC or DC loads and four optically isolated AC loads. Bytech contains 16 I/O lines with TTL interface, and Rytech is a relay board that contains eight 5V miniature DPDT relays and a relay driver.

To enable the Apple II to communicate with the remote-control modules, SMT manufactures the Aptech controller card, which plugs into an available slot on the Apple II. The controller contains a real-time calendar clock with battery backup and 2K additional memory for application programs. Each controller comes with a diskette that contains examples of typical applications, such as data acquisition, process control, and energy management. *(List Price: Adtech, $299; Datech, $209; Tritech, $269; Bytech, $129; Rytech, $159; Aptech, $199)*

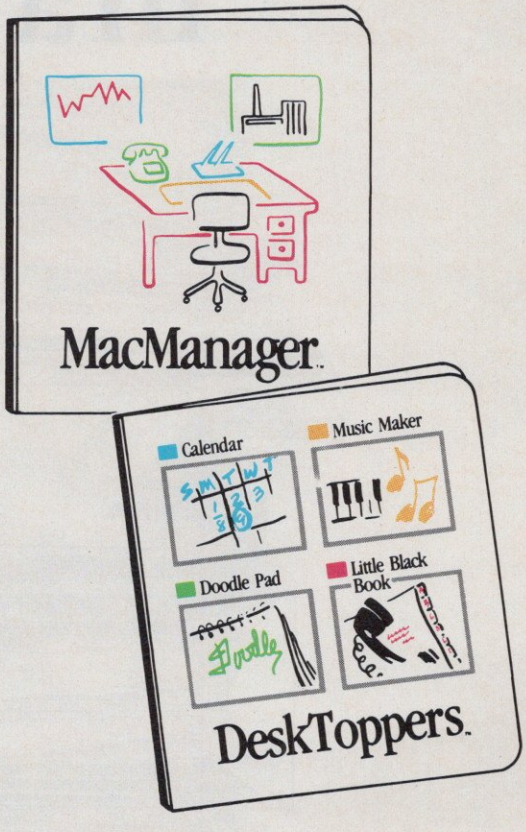
Two Great Reasons For Using A Macintosh™



MacManager™

Do you have what it takes to excel in the world of business? Sit down at your desk in the MacManager office and find out. Hone your business skills by planning a strategy that will rocket your company to the top and leave your competitors in the dust.

MacManager is a competitive business simulation that combines the fun of a game with the excitement of big business decision-making. Up to nine human or Mac-controlled players can compete for a period of one quarter to eight years.

DeskToppers™

DeskToppers is a set of four desk accessories for use with virtually any Macintosh program. Copy DeskToppers to all your applications disks.

MacManager and DeskToppers are available now for $49.95 each. See your Macintosh dealer for a demonstration or order directly by calling (800) 622-4070; (in Illinois call (800) 942-7317).

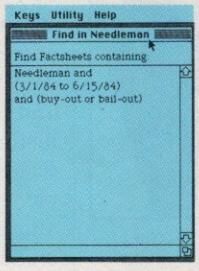
It's easy with Factfinder.™ Because Factfinder is a kind of electronic "desk-drawer" where you can just toss information without worrying about how it should be arranged or how you might want to use it. There are no fields to define, no formats to set up.

When you need to find all the clients you have who hate olives or live in Denver; when you want to collect your notes on pasta merchandising; when you need the name and number of that guy who's looking for leveraged buyouts, it's yours in a few seconds, at your index fingertip.



You just key in your notes on the Needleman Plan (or Needleman vs. Nardoff or the Needleman Noodles campaign) in any length you want, and click the mouse on a few key words—"fallout," "bail out," "roll-out," "leveraged buyout," whatever.

Then, any of those words or part of those words will bring you a stack of notes you've made that include "Needleman," or "leveraged buyouts," "national rollouts" or miracle "bail-outs." Or you can request Factfinder to get you the Factsheet that contains "Needleman" *and* "bail-out." Or you can ask for anything that mentions "bail-out" *or* "Needleman."

And Factfinder has all kinds of features like zoom and automatic wrap to help you manipulate the heck out of your data, and make it whatever size and shape you want.

Contact your Macintosh™ software dealer, or call 1 800 MACWARE to find out where you can get Factfinder.

Walt Disney Personal Computer Software and Sierra On-Line have released two products in their new Disney/Sierra series of educational software.

A game that develops mapping and reading skills, Winnie the Pooh in the Hundred Acre Wood challenges children of ages 7 and up to find objects scattered through the Hundred Acre Wood. Players must search for a different group of ten objects in each game and return the objects to their rightful owners.

Mickey's Space Adventure uses children's mapping and problem-solving skills while it teaches them about our solar system. Players join Mickey and Pluto as they search for the planet Oron's past. The memory crystal that contains the history of Oron has been shattered into nine fragments and scattered in space. Guided only by an on-board computer, the child must direct a spaceship through our solar system and retrieve the crystal fragments in the right order. *(List Price: $39.95 each)*

THE MOST REVOLUTIONARY ATTACHMENT TO THE MACINTOSH™ SINCE THE MOUSE.

The Bernoulli Box™, the cartridge disk subsystem that revolutionized mass storage for the IBM PC, XT, most compatibles, and the TI Professional, now proudly adds Apple's Macintosh to the list.

The Bernoulli Box and its 5-megabyte removable cartridges together deliver unparalleled data base dynamics. And that, more and more, is what your business needs today. Not centralized, monolithic banks of information, but data bases defined by job function and software application. Data bases that give people the versatility to work more productively.

But there is more. More performance and reliability. Transfer rates and access times faster than most Winchesters. No head crashes ever. And cost per megabyte that Winchesters cannot touch.

The Bernoulli Box's cartridge capacity, portability and absolute interchangeability give your business more options. You can easily build primary data bases. You can package individualized data bases, software and all—for payroll, accounting, marketing, computer graphics—in convenient, dedicated cartridges. And you can pack all of the data into a briefcase, an interoffice envelope, or even a file drawer.

The Bernoulli Box. When placed beside Apple's "computer for the rest of us," the best box you can buy. **For the dealer nearest you, call 1-800-556-1234, ext. 215. In California, call 1-800-441-2345 ext. 215.**

Do spreadsheets faster and easier with complete cursor control on the programmable IIe Tender Keypad.

The Apple IIe* is a nice computer. Until you try to do a ledger, a VisiCalc** spreadsheet...or for that matter, any program that uses numbers. It could take days.

Cursors!
What you need is the IIe Tender. It's the Apple* keypad that gives you cursor control in all directions, as well as four programmable keys which can be permanently defined to any frequently-used key. And redefined at will.

At your fingertips.
You also get the four mathematical functions, a decimal point, comma, space bar and delete key. Plus, the IIe Tender is human engineered to provide you with a sure touch and less user fatigue, and comes standard with Coupler-Calc software to turn it into a fixed or floating-point calculator. It's even color-coordinated to match your Apple.

You can install the IIe Tender–without taking up an expansion slot–in about five minutes. And our interface allows disconnection in seconds without getting inside.

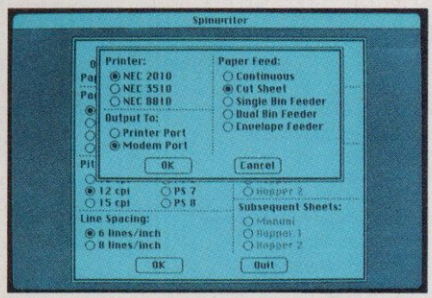
NOW MACINTOSH USERS CAN GET LETTER-QUALITY PRINTING.

Introducing the Spinwriter/Macintosh connection.
There are times when even a Macintosh™ user doesn't want printing that looks like it came from a computer. Important business letters. A make-or-break presentation. A resume. A legal brief.



Works with Spinwriter printers 2010, 3510 and 8810.

Now Macintosh users can have genuine letter-quality printing. And not just ordinary letter-quality but Spinwriter® letter-quality printing.
With NEC's new accessory kit for the Apple™ Macintosh.
Which consists of a diskette (plus a backup), an interface cable and a manual. This easy-to-use package lets you control printing on your Spinwriter with your mouse.

Spinwriter printers have unique capabilities.
You can do more things with a Spinwriter and your Macintosh than other letter-quality printers. Like use our more than 80 different type styles. Or print in a foreign language. Or have proportional spacing.

You can also use a variety of NEC-designed and made paper handlers which let you do such things as address envelopes automatically, right along with your letters.

Spinwriter printers also last a long time. In fact, their record for quality and reliability is unmatched. And survey after survey shows they are the preferred letter-quality printer of personal computer owners.

See your computer dealer, now.
Ask for a Spinwriter printer demo and see what it can do for your Macintosh. Or for more information call 1-800-343-4419; in MA call (617) 264-8635.

You can use NEC automatic paper-handlers with the mouse.

Find out why more and more Apple users are saying, "NEC and me."

The most BASIC.

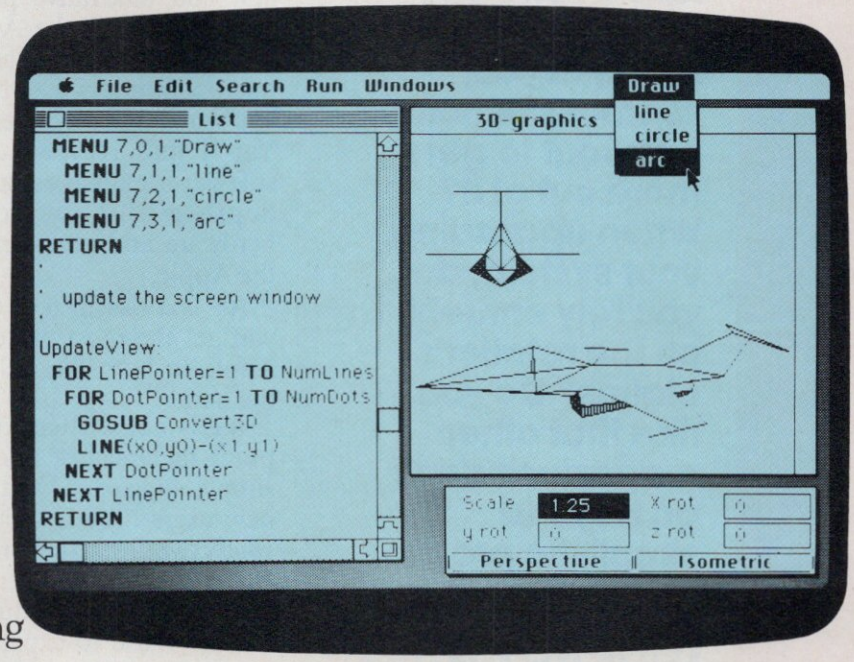
Microsoft® BASIC is the language spoken by nine out of ten microcomputers worldwide. It's the language with the most programs written for it.

So if you want to access the power of your Macintosh,™ only one language makes the most sense. Mac's first language, Microsoft BASIC.

Not only is it the industry standard, it's the most advanced BASIC for Macintosh. It lets you add mouse commands. Graphics. Windows. Change type fonts and styles. Customize menus. Incorporate music and sound effects. Write your own dialog boxes. Basically, it lets you take advantage of everything that makes Mac 'Mac.'

It makes editing programs as easy as cutting and pasting and pointing and clicking. Debugging is easier than ever with the advanced trace command.

It's no wonder Microsoft is the most logical choice for the Macintosh.



MICROSOFT® The High Performance Software

We've written more Macintosh programs than any other software company. Including Mac's spreadsheet, Multiplan.®

So if you want to get the most out of your Macintosh, call (800) 426-9400 for the name of your nearest Microsoft dealer. In Washington State, Alaska, Hawaii and Canada, call (206) 828-8088.

▸ MINDSCAPE SOFTWARE

Mindscape has released four new software products. Crossword Magic, part of the company's Alert product line of recreational software for teenagers and adults, lets users create crossword puzzles on any subject. Users enter words and clues, and the program creates a crossword puzzle. The created puzzles can either be kept on disk or printed out.

Keyboard Cadet, in Mindscape's Folio line of productivity/utility programs, teaches touch-typing and features 3-D graphics and a game format. On-screen animated hands move to appropriate keys to illustrate correct finger reaches and proper hand positioning. Typists move from introductory lessons through key practice to timed tests of typed paragraphs.

Tonk in the Land of Buddy-Bots is one of eight TINK! TONK! programs in the Sprout line of educational software for children ages four through eight. Tonk leads children through the dangers and surprises of Buddy-Bot Land in a search for the parts of a Buddy-Bot robot. The program develops concentration, visual discrimination, and critical-thinking skills throughout its five games, each of which has a choice of difficulty levels.

Finally, Bank Street StoryBook by George Brackett is a story processor in the Pixelwerks software line for children of eight years and over. Children can use the program to create animated graphics and text anywhere on the screen.

A Pause feature lets users control the rate of animation and pace of presentation. Users can either view multipage stories with on-screen dynamics or print them out in book form. *(List Price: Crossword Magic, $49.95; Keyboard Cadet, $39.95; Tonk in the Land of Buddy-Bots, $34.95; Bank Street Storybook, $39.95)*

▸ RAGS TO RICHES SERIES FOR MACINTOSH

Chang Labs' Rags to Riches accounting-software series, designed for businesses with fewer than 20 employees, is now available for the Macintosh. Each module in the series—MacLedger, MacPayables, MacReceivables, and MacSales—is a single-disk program. The implementation of the series for the Macintosh makes full use of graphic icons, pull-down windows, and the mouse.

The Ledger module assigns up to 100 accounts and constantly displays income, expenses, assets, liabilities, estimated profits, and net worth. It also provides reports such as audit trails, chart of accounts, and transaction backup reports. The Payable module provides users with an automated bill-paying system, the Sales module acts like a sales-register system, and the Receivables module shows the exact status of any customer account and can print invoices and statements.

Also available are four Rags to Riches Solution Booklets.

Q: What does every kid and parent want?

A: Exciting computer software and fascinating reading.

That's exactly what Grolier—famous in every school and home for its *Encyclopedia Americana* and *The New Book of Knowledge Encyclopedia*—is announcing. Two exciting educational computer adventures that combine software with books.

A fun new way to learn about science!

In Grolier's **Secrets of Science Island,**™ you've been shipwrecked on an island with the hurricane season approaching. To build a shelter, you'll travel around the magical, troll-infested island answering science questions, using a book chock-full of amazing facts: *Science Facts You Won't Believe* (included with the software—the book will amaze adults too).

Geography and history come alive!

Treasure Hunter™ takes you and your pilot-guide, Baron von Riches, on a worldwide adventure in search of the pieces of a lost treasure map. For help, you'll turn to the book, *Explorers and Discovery* (included with the software), as you join in with the whole family in challenging explorations for fascinating facts.

Secrets of Science Island and **Treasure Hunter**—a great new way for parents and kids alike to learn science, geography, and history and to develop valuable reference skills.

Both programs are available **now** for the entire Apple® *II* Family and include activity books. Developed by Intentional Educations (co-developers of the best-selling **Bank Street Writer**™) and published by Grolier as the first of its new **Adventures in Knowledge Series.**™

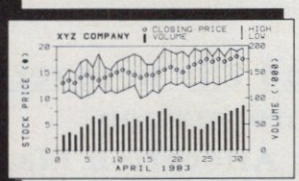
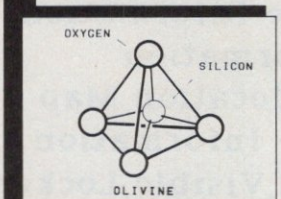
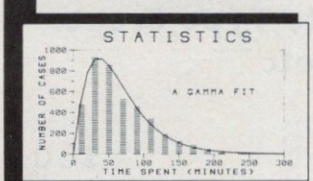
*Praise Our Own Product? The Reviewers Have Done It For Us!**



"The Prime Plotter is the kind of graphics package you'd expect to find on a mainframe computer." "Once mastered, there is no plotting package that is quite this versatile and powerful."
Gregory MacNicol
InfoWorld September 5, 1983



"The Prime Plotter contains more power than any graphing package I have used." "It can do many things not found in other packages; I know of no competing program which can do as much!"
David Morganstein
Washington Apple Pi May 1983



"The Prime Plotter is a surprisingly complete plotting package designed for a variety of applications. Routines to create X-Y plots, 3-D charts, bar graphs, and figure charts make the product the most powerful plotting package the reviewer has seen." "The product is superb for creating 'slide-show' presentations of generic data."

☐ Yes ☐ Not Me

2) Have you ever needed research data for a report and needed it quick, just when you didn't have the time or personnel or money to get it? (Or the library was closed?)
☐ Yes ☐ Not Me

3) Would you like to bank electronically, pay your bills automatically on the day they're due, and never need to ask the bank or wait for a statement to see what's going on?
☐ Yes ☐ Not Me

4) Have you ever wondered why other people are getting free software from computer bulletin boards and you're not?
☐ Yes ☐ Not Me

5) Would you like to be your own stockbroker, with access to the same information your broker has, so you could do it better yourself with no one second-guessing you?
☐ Yes ☐ Not Me

6) Have you ever wanted to send a picture to somebody thousands of miles away, instantly?
☐ Yes ☐ Not Me

7) Have you ever wanted to know more about a place you've planned to visit, a new car you like the looks of, a disease you hear your dog has, or a company you might buy stock in? Is there an author you just discovered, a politician appearing on the scene, or a piece of legislation you want to read whole? Do you need the right recipe for a dish you'd like to try cooking, or the weather in Morocco, an update on a soap opera, or a profile on the new Prime Minister of India? Do you want a review of new movies or local restaurants, or a description of new software for your Apple?
☐ Yes ☐ Not Me

8) Have you been using your computer as a replacement for your typewriter or calculator instead of as a tool for rapid communications and a source of instant information?

9) Did you ever wonder why so many other people have modems?
☐ Yes ☐ Not Me

10) Now do you know?

ONLY THE ZOOM/MODEM IIe gives you all the hardware and software you need to go online, in one package:

1) Plug-in 300-baud modem board includes auto-dial in tone or rotary, auto-answer, monitor speaker, 100% Micromodem IIe compatibility, and more.

2) Communications software provides text trapping and disk storage, with DOS and ProDOS compatibility.

3) Over $200 worth of memberships and connect-time for three of the best, most useful information services: Dow Jones, NewsNet, and Delphi.

4) A Directory of 100 ways to use your modem (just for starters!)

5) A ZOOM Hot Line operator, to help you personally, if you have a question you can't answer yourself. ("How do I turn on the modem?" or "How can I find out about five-legged asthropoids?")

6) Suggested Retail Price $179. With Advanced Communications Software $229.

▸ ADVENTURE GAMES FROM TRILLIUM

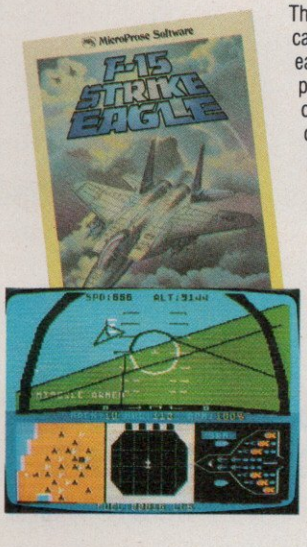
Amazon, Fahrenheit 451, Rendezvous with Rama, Dragonworld, and Shadowkeep are adventure games based on novels by well-known science-fiction authors. In each of the games the player takes the role of the novel's main character.

In Amazon, by Michael Crichton, the player is an agent for NSRT, a high-tech research firm. The player's assignment is a solo expedition to the Amazon, where the goal is to locate the Lost City of Chak and recover emeralds.

In Fahrenheit 451, based on Ray Bradbury's award-winning book, the player lives in a future totalitarian society whose government is committed to controlling the populace.

F-15 STRIKE EAGLE

Put a $20,000,000 Thrill in your Computer!!!



The F-15 STRIKE EAGLE, one of the world's most sophisticated fighters, costs the Air Force more than $20,000,000.00 each. Now you too can strap into your ejection seat and prove how good you really are in exciting modern jet fighter combat. Fly combat missions, engage enemy aircraft, and destroy enemy ground targets from historic missions over Southeast Asia to today's defense of the strategic oil routes through the Straits of Hormuz.

F-15 STRIKE EAGLE (simulator) has all the features that makes the real EAGLE the great fighter aircraft it is — afterburners, multiple radars, air to air missiles, high explosive bombs, cannon, drop tanks, Electronic Counter Measures (ECM) flares, electronic ground tracking maps, Heads Up Display (HUD), outstanding 3-dimensional cockpit visibility, and realistic F-15 maneuverability. Your mission is to take off from your base, fly to and destroy your primary target through all the dangers of enemy territory including Surface to Air Missiles and enemy aircraft. Of course, you have to get back home again, too!!

F-15 STRIKE EAGLE is a very real simulation, accomplished with the guidance of real fighter pilots, and includes seven different combat missions, four skill levels, and an infinite number of exciting scenarios. F-15 will thrill and challenge you and give you the chance to prove you have the "Right Stuff" of an EAGLE fighter pilot!!

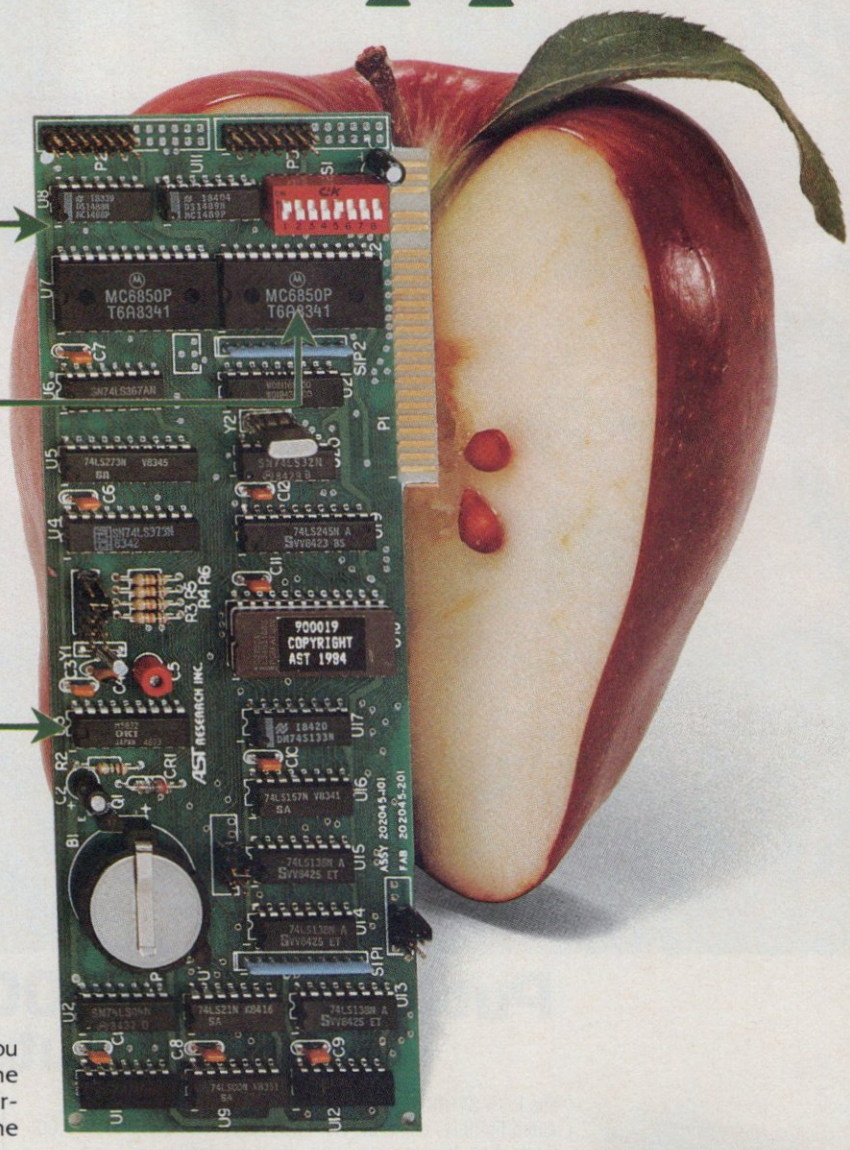
AST's into Apples!

Printer Serial Port

Terminal/ Modem Serial Port

Clock Calendar



At AST, we are consistently thinking of ways to help you get the most out of your personal computer. We set the standard with enhancement products for the IBM Personal Computer, and now we are striving to do the same for Apple™ computers.

Introducing Multi I/O,™ the most comprehensive enhancement board you can buy to fill the slots in your Apple IIe.™ With Multi I/O, you only need one board and one slot to do the job of three. You see, Multi I/O gives you a printer serial port, a terminal/modem serial port, and a ProDOS™-compatible clock/calendar with battery backup all on one card!

The printer serial port gives you the ability to access letter quality printers. Using the terminal/modem serial port you can communicate with others via a telephone modem or hook up another terminal. And no matter how you use your Apple IIe, the clock/calendar is silently ticking away, providing you with the accurate date and time even when your computer is turned off.

Interested? Wait, there's more. Multi I/O is easy to use and plugs into any of the slots typically designated for one of its three functions. Putting three functions on one card reduces power consumption so you won't have to spend any additional dollars on auxillary power. And if you compare prices, you'll find that for a few extra dollars, Multi I/O will provide you with three functions instead of one!

So, there you have it, another innovative product from AST. We've set the standard once, and we'll do it again by bringing you the type of quality you expect, but at a very low price. Visit your local computer retailer today, or contact AST Research for a dealer near you.

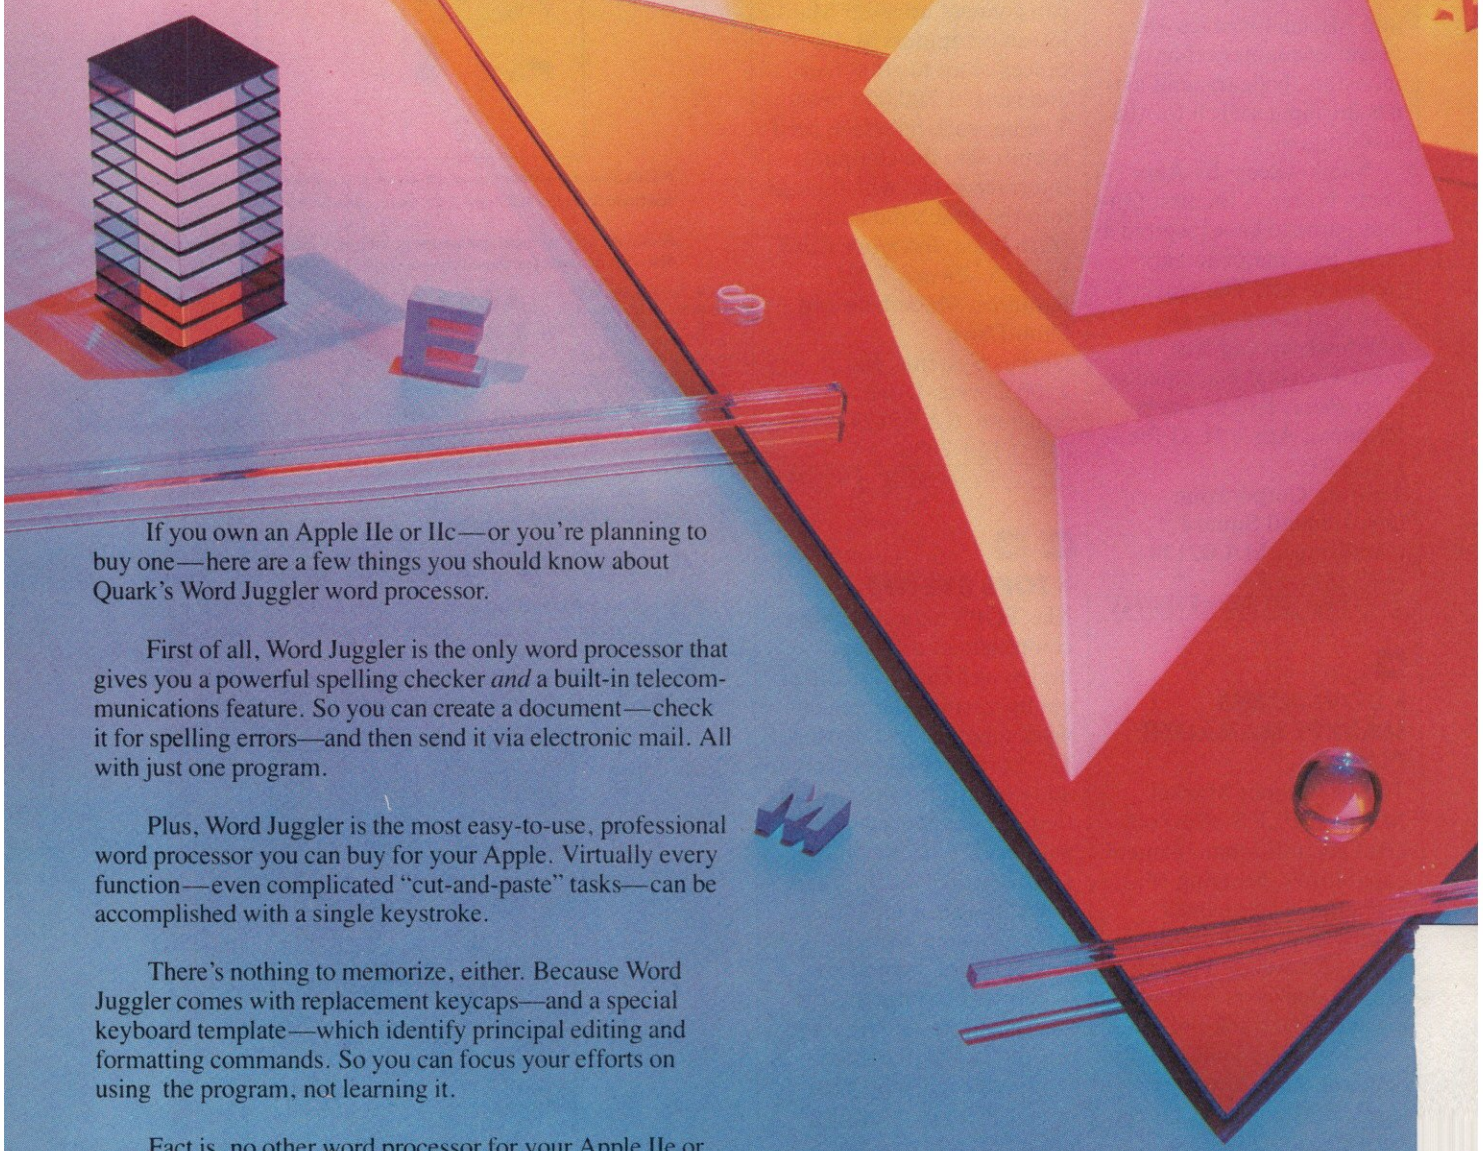
What every Apple owner should know about WORD JUGGLER.™



If you own an Apple IIe or IIc—or you're planning to buy one—here are a few things you should know about Quark's Word Juggler word processor.

First of all, Word Juggler is the only word processor that gives you a powerful spelling checker *and* a built-in telecommunications feature. So you can create a document—check it for spelling errors—and then send it via electronic mail. All with just one program.

Plus, Word Juggler is the most easy-to-use, professional word processor you can buy for your Apple. Virtually every function—even complicated "cut-and-paste" tasks—can be accomplished with a single keystroke.

There's nothing to memorize, either. Because Word Juggler comes with replacement keycaps—and a special keyboard template—which identify principal editing and formatting commands. So you can focus your efforts on using the program, not learning it.

Fact is, no other word processor for your Apple IIe or IIc gives you this unique combination of power, functionality and ease of use. And if all these advantages aren't compelling enough, check the price. Suggested retail is only $189.

So visit your favorite dealer today. Ask for a complete demonstration—and for a copy of our brochure, "What Every Apple Owner Should Know About Word Juggler." If you don't have a favorite dealer, but would like one, just call 1 (800) 543-7711. We'll fix you up.

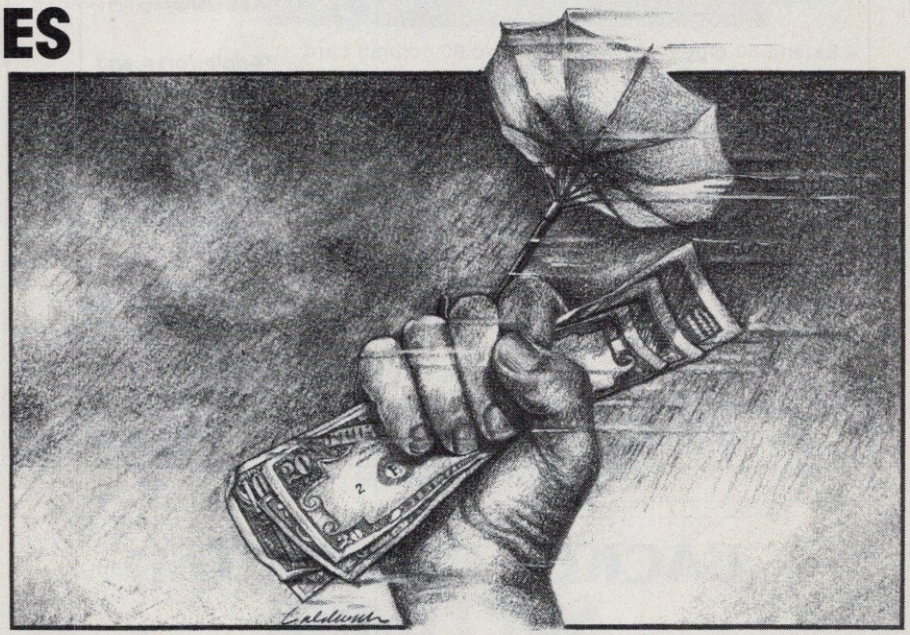
MONEY MATTERS
BY KENNETH M. LANDIS
This final installment in a three-part series on tax planning introduces you to the AMT.

ALTERNATIVE-MINIMUM-TAX STRATEGIES



As a great lama, who had retreated to the highest peak in Tibet to deliberate on man, once said, "I'm not perfect, there is too much responsibility in it." Well, in the December 1984 issue of *A+*, I revealed that I, too, am not perfect.

In that issue, I said that this month we would use Forecast from Monogram to do tax planning. But we can't. Why? When I was writing this month's column, Forecast was not yet available. Monogram has since released Forecast, though (see Pipeline in this issue) and if you own Monogram's Dollars and Sense, you should look into it.

So, instead of talking about tax planning in general, we are going to learn about a specific tax and ways to plan around it.

The tax is the alternative minimum tax (AMT). To plan around it, we are going to use the program we used last month to prepare our taxes—the Tax Manager from Micro Lab of Highland Park, Illinois.

Basically, the AMT is an add-on tax that comes to us courtesy of the Congress of the United States, specifically through the Tax Equity and Fiscal Responsibility Act of 1982—commonly referred to as TEFRA—the Congress's answer to Japanese monster movies.

The bottom line of the AMT is that it tries to make you pay at least a certain amount of your income in taxes, no matter how hard you try to shelter it.

Now that you know that no matter how hard you try to shelter income from taxes, you are probably going to get it in the end, you'll want to know how big your end is going to be. The AMT computation is very simple—it's 20% of your alternative-minimum-taxable income after exemptions. It's computing your alternative-minimum-taxable income that gets complicated.

Simply Complicated

You start with your adjusted gross income. Next, total your medical and dental expenses and subtract from that sum 5% of your adjusted gross income; deduct this amount from your adjusted gross income. Then, deduct your contributions and casualty and theft losses (up to the amount the law allows); interest on your home mortgage; and whichever is less—your other interest expenses or your net investment income (you can't use both).

No matter how hard you try to shelter income from taxes, you are probably going to get it in the end.

All of these items are known in the tax trade as "favored alternative tax itemized deductions." They reduce your alternative-minimum-taxable income. Thus, for planning purposes, they are good. It is the "tax preference items" that are bad.

Tax-preference items are those deductions on your income-tax return that represent a conscious effort to shelter your income from taxes or are exclusions oriented toward the "common man," which, if you are subject to the AMT, Congress has decided that you are *not*.

The shelter-oriented tax-preference items are depreciation on real or leased property, amortization of pollution-control facilities, mining exploration and development costs, certain research-and-development costs, reserves for losses on bad debts of financial institutions, depletion allowance, incentive stock options, and intangible drilling costs.

The common-man items are the

$100/$200 dividend exclusion, all-savers interest exclusion, and the 60% capital-gains deduction.

In every case, either the entire amount or a percentage of it (based on the law) is added back to your already adjusted, adjusted gross income. The result is your alternative-minimum-taxable income. But what about the tax?

From your alternative-minimum-taxable income you can deduct $40,000 for a joint return or surviving spouse; $30,000 for single or head-of-household filer; or $20,000 for married taxpayers filing separately, or on returns for estates or trusts. Once you have taken the exemption, you multiply the result by .2 or 20%. Voilà, your alternative minimum tax! But you are not done yet.

From your alternative minimum tax, you deduct your total tax (form 1040, line 49). Then, if you have any foreign tax credits, you can also deduct them within the limitations established under the law. If, at the end of this whole process, you have a positive number, you add it to your form 1040, and that's how much money you owe Uncle Sam.

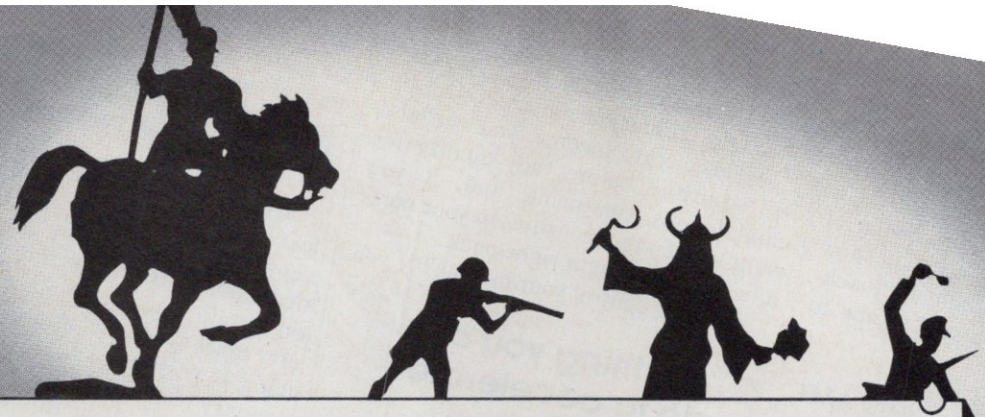
Statistically, Maybe

Are you subject to the AMT? Generally, if you earn more than $100,000 a year, you stand a one-in-ten chance of being subject to the tax. Another good indicator is the amount of your preference items—if they total at least 40% of your expected gross income, you are probably headed for the AMT.

Now, before you decide to rent an empty pizza parlor and hang up an "alternative minimum tax advice" sign, be apprised. We have just scratched the surface of this complex, confusing tax. About the only advice you could give people is that they see their tax advisers if they think they might be subject to the AMT.

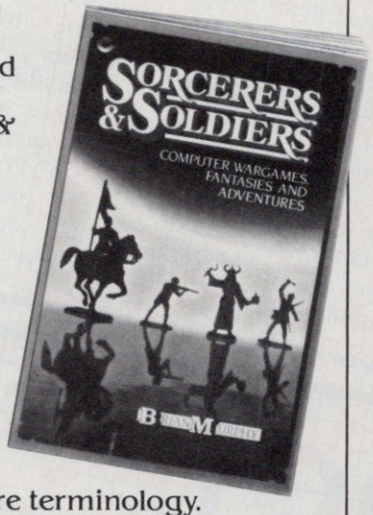
Finding out if you are subject to the tax and analyzing your alternatives are another matter, though. You don't need to be an expert to evaluate or plan, only to execute.

An excellent way to check to see if you are subject to the AMT is to use the Tax Manager program. The first and most obvious use for your Apple and Tax Manager is to automate all of the calculations. In minutes (rather than hours if you were doing the task manually), Tax Manager does all of your calculations by pulling in information that resides in other parts of your return so you don't have to key it in. The more complicated your return, the



VICTORY CAN BE YOURS ON THE ELECTRONIC BATTLEFIELD WITH SORCERERS & SOLDIERS

Conquest and glory await within the depths of your computer. You can mobilize whole armies with a single keystroke, uncover buried treasure, dodge sniper fire and save civilizations with the adventure games in *Sorcerers & Soldiers.*



Sorcerers & Soldiers is the one book that explains the concepts, rules and winning strategies behind the computer fantasy, war and role-playing games available today. Daring and game-winning moves will be your trademark as you learn to think as deviously as the people who write the games.

Beginning with the history of gaming, the book provides descriptions, tactics and even hardware requirements of popular games plus an extensive glossary of adventure terminology.

Here are just some of the games you'll find in Sorcerers & Soldiers:
• Fighter Command • Germany 1885 • Pursuit of the Graf Spee
• Computer Ambush • Battle for Normandy • Wizardry • Tanktics

more rules your Apple must memorize; thus, the more powerful an aid such as Tax Manager becomes.

Once you have a rough version of your return, Tax Manager will show you if you are subject to, or approaching, the AMT. If you are, it's time to start planning.

Strategies

Strategies for dealing with the AMT fall into one of three major categories: reducing preference items, accelerating income, or delaying deductions.

By reducing your tax-preference items, you reduce the dollars that are added back to your income; thus, you reduce your alternative-minimum-taxable income. If you are subject to the AMT, reducing your preference items enough will put you below the tax's threshold.

If your preferences come from deducting shelter-oriented items, such as intangible drilling costs or research-and-development expenditures, slow down. Instead of deducting the maximum allowed under law, in the shortest time, deduct less over a longer period of time.

If you have a tax preference that stems from exercising incentive stock options, sell some shares before they qualify for capital-gains treatment. You will have converted a preference item into ordinary income.

To accelerate income, you can also sell securities before they qualify for capital-gains treatment; and, if you want to keep the securities in your portfolio, just buy them right back.

Can you control your income? If you had a bonus coming in January or February, could you get it in December instead? If so, you would increase your income and possibly decrease your chances of being subject to the AMT.

Anything you can do to accelerate or increase your income, without taking steps to shelter it, can help you avoid the AMT.

Anything you can do to accelerate or increase your income, without taking steps to shelter it, can help you avoid the AMT.

If you think that accelerating income sounds a bit strange as a way to help you save money, then delaying deductions must sound positively maniacal. The normal strategy for saving money on your taxes is to delay income and accelerate deductions, but with the AMT, the world can appear topsy-turvy.

By delaying a deduction, you shelter less income, which makes you less susceptible to the tax. How can you delay deductions? By not making payments on certain items—state taxes and property taxes are two examples—until January. If possible, pay any deduction in January instead of December.

Stop! Has all of this expensive, yet free, tax advice given you the willies? Almost every piece of advice encourages you to increase your taxable income, which may well end up increasing your taxes.

Let Your Apple Do the Work

Here's where your Apple earns its keep by testing each strategy to see if it lowers or increases your taxes. Tax Manager increases the speed and accuracy of your calculations and advises which strategies to pursue. If you accelerate too much income, you will be paying taxes based on your marginal-tax rate, which can run as high as 50%. At those rates, the 20% AMT tax could be a bargain.

The effects of any strategy vary

Our Last Ad?

We have been *trying* to tell you about our program for **Apple™ Dot Matrix, Imagewriter™** and **Epson™ FX-80 / FX-100** printers.

But you haven't taken the time to see what we can do for you and your printer. You don't know how good your printer really is. You don't know about our **20 DOWNLOADABLE character sets**, or that they can be **used with ANY Apple II program** to upgrade your printed work to near letter quality. You don't seem to care that our program **COMPLETELY eliminates the need to learn control characters** to control your printer, or that our program lets you **save setup information to disk** for later recall. You must be one of the very few who *enjoys* reading printer manuals.

OK. You Win. We'll stop running these ads and leave you alone. But we want to give you one last chance to see what **Softalk** (Feb 84) meant when they described our program as ***"excellent"***. We want to make sure that you know that **Creative Computing** (June 84) liked our program so much they said it was ***"a necessity"***

So, before we leave, don't you think you should take the time to see just what you've been missing? Before it's too late. If you send us your name, address, printer type and interface type we'll send you a more complete description with examples of all our 20 character fonts.

WRITE YOUR OWN APPLE GAMES

Includes 40 exciting pre-programmed games to get you started!

Write Your Own Apple Games is your ticket to thousands of hours of solid game fun.

But it's more than just a game book.

While you're enjoying more than 40 exciting new programs, you'll be learning—quickly and easily—the most advanced techniques of computer game design.

In ***Write Your Own Apple Games,*** Stuart Anstis explains each game to you in logical, step-by-step subroutines. You'll see crucial game graphics exactly as they should appear on your screen.

Then you'll learn how to rearrange the basic subroutines to create countless game variations.

If you know BASIC, you're ready to learn state-of-the-art game techniques, including how to:

- Create smooth, flicker-free screen movement
- Generate flashing "neon-sign" graphics
- Keep game scores
- Use random numbers in game design—and make your computer come alive as an opponent
- Zero in on random time delays—a challenge to even the most sophisticated arcade player

And much more.

Write Your Own Apple Games gives you all the skills you need to start designing your own original computer games for fun—and profit!

And because writing your own games gives you greater control of your Apple's numerical and graphic capabilities, you'll be opening the door to fantastic new possibilities for using your computer.

Write Your Own Apple Games should sell for over $1,000—the cost of 40 pre-packaged games.

But you can get ***Write Your Own Apple Games*** for only $12.95. That's less than 32 cents a game—and every game you write yourself is virtually free!

Start having some serious fun with your Apple computer. Send for your copy of ***Write Your Own Apple Games*** today.

What made over 100,000 Apple II owners fall in love with System Saver?

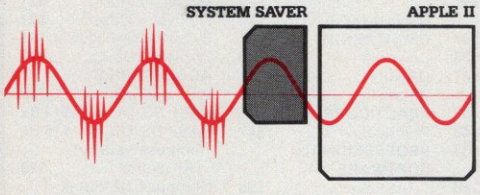
It's the most versatile, most convenient, most useful peripheral ever made for the Apple.®

System Saver® filters out damaging AC line noise and power surges.

70-90% of all microcomputer malfunctions can be traced to power line problems.* Problems your System Saver guards against.

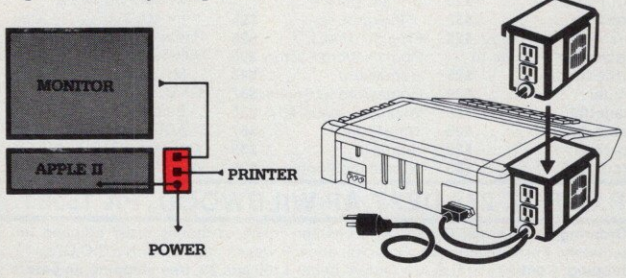
Power line noise can often be interpreted as data. This confuses your computer and produces system errors. Power surges and spikes can cause severe damage to your Apple's delicate circuitry and lead to costly servicing.

System Saver clips surges and spikes at a 130 Volts RMS/175 Volts dc level. A PI type filter attenuates common and transverse mode noise by a minimum of 30 dB from 600 kHz to 20 mHz with a maximum attenuation of 50 dB. You end up with an Apple that's more accurate, more efficient and more reliable.



System Saver makes your Apple more convenient to use.

No more reaching around to the back of your Apple to turn it on. No more fumbling for outlets and cords to plug in your monitor and printer. System Saver organizes all your power needs.

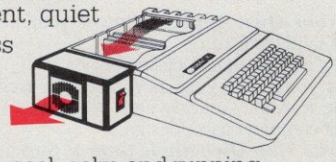


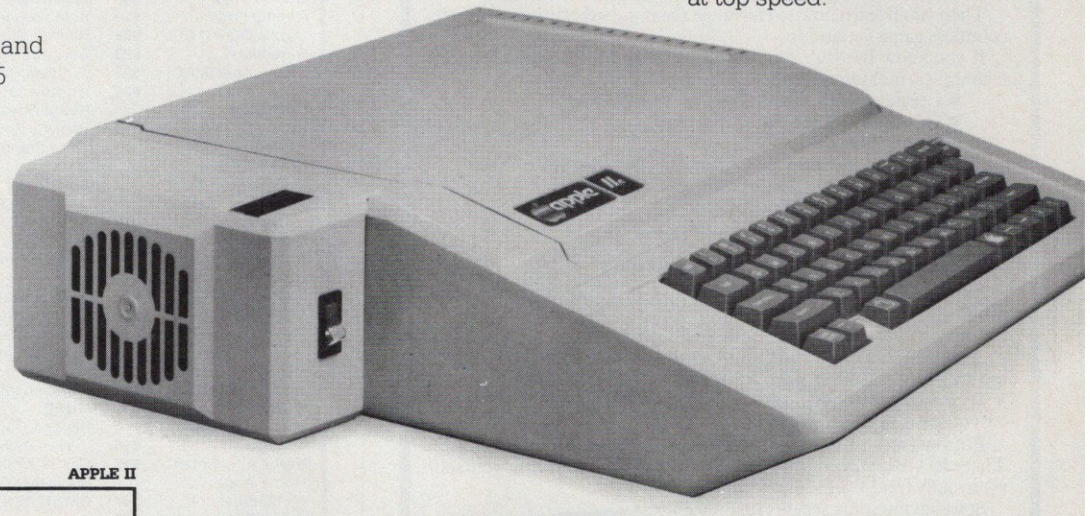
It functions as a multi-outlet power strip with two switched outlets. Plus System Saver offers the ultimate convenience; a front mounted power switch for fingertip control of your entire system.

System Saver lets your Apple keep its cool.

Today's advanced peripheral cards generate heat. In addition, the cards block any natural air flow through the Apple IIe creating high temperature conditions that shorten the life of the Apple and peripheral cards.

System Saver's efficient, quiet fan draws fresh air across the mother board, over the power supply and out the side ventilation slots. It leaves your Apple cool, calm and running at top speed.





So if you want to keep damaging heat, line noise and power surges out of your system for good, pick up the only peripheral that's in use every second your computer is in use. The System Saver. You'll soon come to think of it as the piece Apple forgot.

Compatible with Apple stand

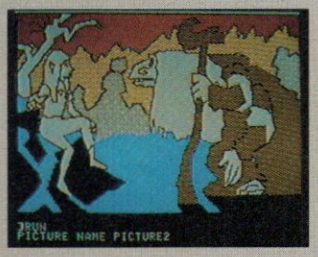
THAT'S entertainment



You are Jen, one of the last survivors of the Gelfling Race. You must find the missing shard of crystal and restore it to save the world from evil.

ADVENTURES WITH THE DARK CRYSTAL

In the movie *The Dark Crystal*, Muppet creator Jim Henson leaves the comic exploits of Kermit the Frog and Miss Piggy behind and weaves us a heroic tale of Jen and Kira, the last survivors of the Gelfling race. Gelfling Adventure, a graphic adventure game for kids based on the movie, propels you into the story line in a quest to save the world from evil.

As in most other adventure games, you take on the role of one character—in this case, Jen. With little information, you must explore the world around you to discover clues and hints that will help you solve a particular puzzle.

The illustrated screens provide a visual delight that seems to push Apple graphics to the limit. Artists Carl Potts, Michelle Prichard, and Greg Rowland deserve a hand for recreating the world of The Dark Crystal in painstaking detail.

Unlike most adventure games, which require you to type in two-word instructions, Gelfling Adventure makes you pick from a list of three choices at the bottom of the screen. This approach is both a strength and a weakness.

On the one hand, it is certainly easier for youngsters to pick a choice than it is to think up an action and type in words. Play moves faster and boredom rarely sets in. On the other hand, multiple-choice actions tend to herd you in a few set directions and limit the opportunity to solve puzzles from a completely different direction.

Since the game is based on the movie, the plot revolves around finding the missing shard of a crystal and restoring it to the crystal when three moons overlap—also a mixed blessing.

Although all the familiar sights and situations that made the movie popular are in the game, the solutions to the puzzles and problems also mimic the movie. If you saw the movie, you can escape any peril by repeating Jen's actions in the film.

If you have not seen the movie, the game can be pretty challenging, especially for the audience the game aims at—youngsters aged nine and up. Plan on spending a long afternoon figuring out the path

If you saw the movie, you can escape any peril.

through the maze of multiple choices. Even we veteran adventure gamers who'd seen the movie took an hour or two to heal the crystal.

The game needs no documentation, since you choose all actions from the screen, but Sierra includes an eight-page booklet with an informative "Gelfling Glossary," which is a Who's Who and What's What in the world of The Dark Crystal, and a black-and-white map of the world.

Gelfling Adventure is challenging and intriguing—once. If you have not seen the movie or did not enjoy it, you have little reason to buy the game. If you liked the movie, you should like the game, for it is a faithful recreation. You also know the ending and how to solve the puzzles, though, so after one session, Gelfling Adventure will probably wind up collecting dust on a shelf.

LODE RUNNING GETS TOUGHER

Back in the May 1984 issue of *A+*, we reviewed a frenetic arcade game called Lode Runner. Its premise was simple: run through the progressively more difficult mazes, evade the deadly Bungeling Empire guards, and pick up all the gold chests. At times, you had to tunnel through floors to grab the treasure. All in all, Lode Runner was a simple, fast-paced, and challenging arcade game.

Mean Screens

Well, Lode Runner's big brother, Championship Lode Runner, just checked into our Apple. It contains 50 of the meanest, toughest, and most devious screens ever devised to frustrate the fastest joystick jockeys in the galaxy. If you thought Lode Runner was tough, your reflexes ain't seen nuthin' yet.

As in the original, you race up and down ladders, go hand over hand on beams, and free-fall to the floor to outwit guards and grab the gold. On every screen, you must use your laser pistol to drill holes in the floor to gain access to

the chests. The holes fill in after a time, preferably trapping a guard rather than you.

But those screens, those terrible screens, those horrible, nasty, nerve-wracking,

THE NAME TO LOOK FOR WHEN YOU BUY A PERSONAL PRINTER

ISN'T APPLE®.

It's Okidata. If you're buying an Apple printer to go with your Apple computer, we're sorry to disillusion you, but that printer isn't really an Apple down to the core.

In fact, peel away the logo glued on the front and you have a printer made by some other company that just wears the Apple name.

We tell you this because having the right printer is very important. (Without it, how are you going to get all that valuable information that's up on the screen down on the paper?) So, when you buy you should know what you're getting, and with an Okidata you know you'll be getting the very best printer there is.

We live, sleep and breathe printers. We specialize in building printers . . . seven different printer models to be exact. (Apple only gives you four.)

We make fast printers. Apple's speed stops at 120 characters per second in text. But that's where Okidata's speed starts . . . 120 up to 200 characters per second. That's three pages in just one minute.

We make versatile printers. Okidata gives you three print modes; data processing, enhanced/emphasized and correspondence. (You-know-who only gives you two.) Our letter quality is as good as most daisywheels at twice the speed of an Apple. We print all kinds of graphics and charts, and even let you print custom typefaces and symbols.

Mixing Apples with Oki's. If you're wondering how compatible your Okidata will be with your Apple computer, the answer is "completely." And that includes the Macintosh™ as well! Okidata is fully compatible with all popular software packages and personal computers. In fact, with Okidata's unique Plug 'n Play™ kit you can be hooked up to your Apple and printing in virtually minutes.

And if you're wondering about service, it's available nationwide through Xerox Service Centers. Of course, chances are you won't need it. Okidata has the best reliability record in the industry, with a warranty claim rate of less than 1/2 of 1%.

Select, don't settle. So, just because you pick an Apple, don't think you have to buy the whole orchard. Pick the printer with the name that's come to mean performance. Okidata.

Call 1-800-OKIDATA (609-235-2600 in New Jersey) for the name of the Authorized Okidata Dealer nearest you. Okidata, Mt. Laurel, NJ 08054.

JE664 EPROM PROGRAMMER

8K to 64K EPROMS — 24 & 28 Pin Packages

Completely Self-Contained — Requires No Additional Systems for Operation

• Programs and validates EPROMs • Checks for properly erased EPROMs • Emulates PROMs or EPROMs • RS232C Computer Interface for editing and program loading • Loads data into RAM by keyboard • Changes data in RAM by keyboard • Loads RAM from an EPROM • Compares EPROMs for content differences • Copies EPROMs • Power Input: 115VAC, 60Hz, less than 10W power consumption • Enclosure: Color-coordinated, light tan panels with molded end pieces in mocha brown • Size: 15⅜"L x 8¾"D x 3½"H • Weight: 5¾ lbs.

The JE664 EPROM Programmer emulates and programs various 8-Bit Word EPROMs from 8K to 64K-Bit memory capacity. Data can be entered into the JE664's internal 8K x 8-Bit RAM in three ways: (1) from a ROM or EPROM; (2) from an external computer via the optional JE665 RS232C BUS; (3) from its panel keyboard. The JE664's RAMs may be accessed for emulation purposes from the panel's test socket to an external microprocessor. In programming and emulation, the JE664 allows for examination, change and validation of program content. The JE664's RAMs can be programmed quickly to all "1"s (or any value), allowing unused addresses in the EPROM to be programmed later without necessity of "UV" erasing. The JE664 displays DATA and ADDRESS in convenient hexadecimal (alphanumeric) format. A "DISPLAY EPROM DATA" button changes the DATA readout from RAM word to EPROM word and is displayed in both hexadecimal and binary code. The front panel features a convenient operating guide. The JE664 Programmer includes one JM16A Jumper Module (as listed below).

JE664-A EPROM Programmer. $995.00
Assembled & Tested (Includes JM16A Module)

JE665 — RS232C INTERFACE OPTION — The RS232C Interface Option implements computer access to the JE664's RAM. This allows the computer to manipulate, store and transfer EPROM data to and from the JE664. A sample program listing is supplied in MBASIC for CP/M computers. Documentation is provided to adapt the software to other computers with an RS232 port. 9600 Baud, 8-bit word, odd parity with 2 stop bits.

EPROM JUMPER MODULES — The JE664's JUMPER MODULE (Personality Module) is a plug-in Module that pre-sets the JE664 for the proper programming pulses to the EPROM and configures the EPROM socket connections for that particular EPROM.

knuckle-whitening screens can cause premature brain damage. Give the half dozen or so screen designers credit—they have created the most difficult mazes modern gamers have ever encountered.

Heart-Pumping Action

The graphics are pretty straightforward. Your stick figure moves across nondescript blue bricks, away from the stick figures representing guards. Simple beeps and tones suffice for sound effects. As with the original, Championship Lode Runner emphasizes heart-pumping action rather than slick sound and graphics.

You will probably spend an hour conquering the first screen—even if you "cheat" by looking at the hint booklet. That's right. The screens are so difficult that Brøderbund includes a 52-page booklet detailing the exact tactics you need to beat the game.

Hard-Core Challenge

If you've never played Lode Runner, steer clear of this tougher big brother. Try the original first—it will save you a great deal of frustration. Veteran Lode Runner fans, rejoice. Championship Lode Runner challenges even the fastest, hard-core arcade gamers.

INTERACTIVE UNDERWATER SALVAGE

Infocom, the pioneer of interactive fiction, has brought out another gem of a text-only adventure game. Cutthroats places you on Hardscrabble Island, a dying little seaport off the beaten path. A motley group of shady characters needs your diving skills and knowledge of the area to mount an underwater expedition to salvage sunken treasure. You receive a cut of the take—if you can survive the perils of the deep and your partners.

Infocom games are a real joy to play, and Cutthroats is no exception. Its prose is truly descriptive and draws you slowly and subtly into the plot. As always with Infocom games, you control the action by using a sophisticated text-parser system that lets you type in complete English sentences. Cutthroats understands more than 800 words—enough to let you try anything your devious little mind desires.

Cutthroats places you on Hardscrabble Island, a dying little seaport off the beaten path.

The documentation is quite extensive, including a tide chart, an issue of *True Tales of Adventure* magazine (which doubles as an instruction manual), and an absolutely marvelous booklet entitled *Four Shipwrecks off Hardscrabble*

SAVING THE WORLD FROM BOOK BURNING

Trillium Software, a division of Spinnaker Software, has licensed several of the biggest names in science-fiction writing for its line of interactive-fiction computer games. Pairing these authors' brilliant work with effective graphics yields the best adventure games to come around in a long time.

In Fahrenheit 451, Trillium's adventure based on the best-selling novel by Ray Bradbury, you take the role of Guy Montag, ex-fireman and fugitive from the law. For those who have never read the book, a totalitarian regime controls the masses through terror and high-powered audio and video reinforcement. In this world, the firemen start fires by burning books (and probably computer magazines too) to keep knowledge from the people. A growing Underground fights back by passing around the outlawed books. As Montag, alone in New York City, you must evade the firemen, contact the

Underground, and devise a plan to save the world from book burning.

Most graphic adventure games, such as Death in the Caribbean and The Sands of Egypt, fill almost the entire screen with a picture, leaving little room for prose. Descriptions are always terse, and your commands consist of two words, a verb and direct object.

At the other end of the spectrum, Infocom's text-only games contain no graphics but are rich in description and use a sophisticated command structure.

Fahrenheit 451 sits right in the middle. The lower two-thirds of the screen contains the deathless prose of the master science-fiction writer. It wraps you in imagery, bringing the classic book alive on the screen and drawing you into the character and the plot. Best of all, the text-parser system, which translates your words into action, is as advanced as that of the Infocom games.

The top third of the screen displays colorful graphics. Although not as realistic as the illustrations in Death in the Caribbean and other graphics adventures, the pictures in Fahrenheit 451 contain enough detail to convey a sense of oppression.

When the subway doors open and a squad of firemen stands waiting to capture you, despair sets in.

Text and graphics together propel you into the story line. For example, when the subway doors open and a squad of firemen stands waiting to capture you, despair sets in. You want to quote the Bill of Rights or at least the part about life, liberty, and the pursuit of happiness. Do yourself a favor and save some mental turmoil—stay out of the subway.

The game comes on four disk sides, which you have to change from time to time. All input is through the keyboard. As with most adventure games, playing time is rather long. Plan on taking several hours, at the very least, to overthrow the regime. The documentation provides a list of acceptable words and a hint section.

I think Fahrenheit 451 is a real winner. Ray Bradbury's prose, effective graphics, and advanced command structure combine to form a truly excellent adventure game. I can hardly wait to play with the rest of the Trillium line—Arthur C. Clarke, Byron Preiss and Michael Reaves, Michael Crichton, Alan Dean Foster, Robert Heinlein, Roger Zelazny, and Philip Jose Farmer.

CROSSWORD PUZZLES ON YOUR SCREEN

Compuzzler puts a crossword puzzle on your monitor. It's the same type of puzzle you find in newspapers or books, but the program does offer a few features that you won't find in print versions.

Typing Control-V lets you know if the words you've filled in are the correct answers to the clues and purges erroneous letters from the squares on the screen. Furthermore, you can press Control-S to sneak a look at the correct letter for the square your cursor is on.

You move the arrow-shaped cursor around the grid with the cursor-control keys. Clues are displayed in pairs, one across and one down, underneath the crossword grid, and you type in the answer from the keyboard. You have the option of replacing the grid with a list of clues, which comes in handy for picking

The program does offer a few features that you won't find in print versions.

out and answering the easy ones first before tackling the hard ones.

Various commands allow you to center the grid, change the font of the letters, change the pattern of the puzzle, toggle colors on and off, and print out the puzzle. Compuzzler includes 70 puzzles, and you can save work in progress.

Compuzzler also contains a competitive game for two players or teams. In essence, each side receives points for correct words or

letters. As with Scrabble, you must use letters on the grid as part of your word, and you can challenge an opponent's answer. Success earns you points, but failure subtracts points from your score. A timer is an available option.

Compuzzler is an excellent crossword-puzzle program. It is easy to use and easy to learn, and it provides hours of challenging fun for crossword-puzzle enthusiasts. My only question is why anyone would purchase a computer program when you can get pretty much the same thing much more cheaply in a paperback book.

LEARN TO SPEAK

Logo is the computer language that's sweeping the country with its simple "turtle geometry" way of learning computer literacy. And *Logo: An Introduction* is the new, easy-to-understand beginner's guide that makes learning and using Logo fun!

Written in simple language and set in big, easy-to-read type, *Logo: An Introduction* is specifically designed to be used by teachers and students who have little or no knowledge of Logo or computers.

Logo: An Introduction helps computer novices with:

- △ Creating simple shapes with the turtle and combining them to make more complex geometric forms
- △ Learning about "soft" and "hard" saves (temporary and permanent computer memory)
- △ Playing with symmetry and curves
- △ Learning about arithmetic, logic and Cartesian coordinates
- △ Using the idea of recursion—making a simple command repeat itself to perform more complex functions
- △ Experimenting with words and sentences

—and more!

Logo: An Introduction doesn't bog you down or scare your students with complex technical details the way instruction manuals do. Instead, this book is written in an open-ended, exploratory style that captures the flexible spirit and freedom of Logo.

Use *Logo: An Introduction* as a supplement to your programming manual, as a sourcebook of ideas, as a primer on how to exploit the potential of this powerful language, and as a treasurehouse of suggestions for experiments with Logo. *Logo: an Introduction* is one book that belongs in your classroom or computer lab—and at only $7.95, it's easy to order more than one, and pass copies around to your students. Fill in and mail the coupon today, and enter the exciting world of Logo!

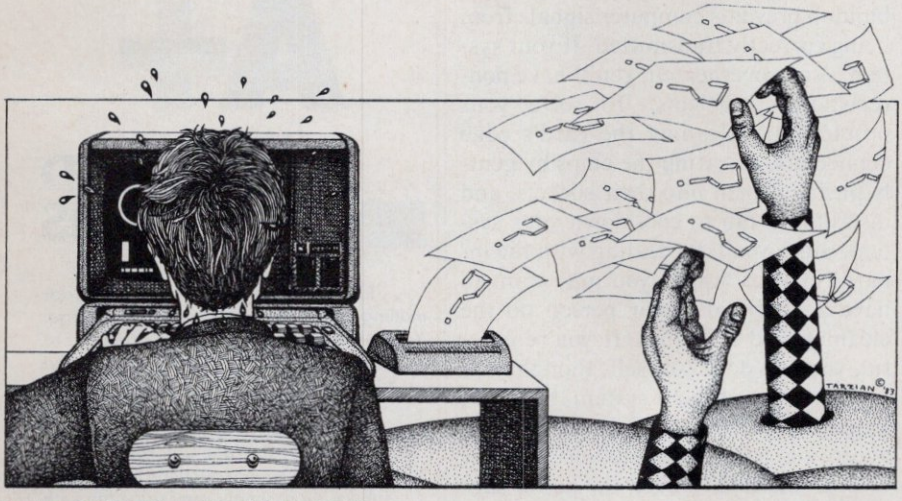
RESCUE SQUAD ▶ BY MICHAEL CALLERY
Questions from our readers



▶ IIe AND IIc COMPARED

Q. *You recently published a list of software that runs on the Apple IIc computer. I have an Apple IIe. Am I already obsolete?*

A. By no means. The Apple IIe and IIc computers are different, but Apple Computer has maintained a high degree of compatibility. For example, the IIc does not have slots for plug-in circuit boards, but the usual PR# commands work as if you had circuit boards in slots (and PR#7 boots the second disk drive on a IIc). Some of the problems with commercial software are due to improper programming. If a program bypasses Apple's "official" way of doing things, it may not work on both computers. Let's look at some of the most important differences between the two computers:

Screen codes—Some of the character-display codes have been changed on the IIc. It cannot display uppercase flashing letters in the active 80-column mode.

MouseText—The strange lettering you see on the IIc when the program thinks it's displaying flashing uppercase 80-column text is called MouseText. These graphic characters—pieces of borders, arrows, and other icons—are not available on the IIe. In addition to the change in the character set, the IIc also has the mouse ROM code that allows programs to read the mouse's status easily. On the Apple IIe, you'll get the ROM with the mouse when you buy the AppleMouse II package, but you won't get the MouseText characters.

Serial Ports—The IIc also contains a Super Serial Card ROM chip. Er . . . almost. There are some differences between the Super Serial Card for the II, II Plus, and IIe and built-in IIc ROM. Here, the tables are turned on IIc owners, because many programs that support the Super Serial Card on the IIe do not run properly on the IIc. Be especially careful with communications and graphics-dump programs.

System ROM—The IIc's system ROM is also different. These changes, among other things, simplify Applesoft program editing, but they rarely affect application programs.

Most of the IIc's other changes are physical. The disk drive uses a different mechanism, and some copy-protected software does not run (IIe owners will have the same problems with the Apple Duodisk).

The printer and modem ports have round, DIN connectors, rather than the standard serial connectors. You must purchase special cables for the IIc—ditto for the disk drive. The mouse/joystick connector has been combined, so you have to unplug the mouse to connect a joystick. Further, the connector is a DB 9-style connector such as that found on the back of the Apple IIe, rather than the 16-pin connector inside the IIe. Few manufacturers other than Apple have adapted their joysticks to fit this port. People who own joysticks or other game-port peripherals that work with the old-style plug must purchase an adapter to connect the device.

The most severe problem for many IIc users is the lack of a Z80/CP/M card option. Rumor has it that a manufacturer is working on an option that will allow for CP/M compatibility through the disk-drive port, but, as of this writing, it's only a rumor. The lack of a Z80 card will be a handicap for people who use CP/M software—WordStar, dBASE II, SuperCalc, Perfect Writer, and so on—at their office and have a IIc at home. Some commercial programs read and reformat the data files from Apple CP/M disks to Apple DOS 3.3, but they are no substitute for the real things.

If you already own an Apple II, II Plus, or IIe and want to use your peripherals with a IIc, you may have to purchase quite a bit of new equipment or adapters. Your Epson parallel printer won't work without a serial/parallel converter, you'll need a game-port adapter or new joysticks, you can't move the second Disk II drive over to the IIc, and so on. The bulk of your old DOS 3.3 software, however, will work with no more than the usual Caps-Lock-down, don't-use-the-delete-key, and don't-use-the-up-or-down-arrow-key problems. Your new ProDOS software—the new double-high-resolution graphics software and most programs marked IIc—will run on an Apple IIe with an Extended 80-Column Card. For a more thorough discussion of double-hi-res graphics, see the December 1984 and January 1985 issues of *A+*.

▶ INDISPOSED COMPUTER

Q. *I have an Apple IIe with a Microsoft Premium Z80 IIe Card and use my system primarily for word processing. After one or two hours, random characters appear on the screen, and the system fails. I have to reboot and lose my document. Help!*

A. Unless you are systematically doing something to cause the system to fail, your problem sounds like overheating. If you have many interface cards, you'll find that the interior of the Apple system box becomes quite hot. The heat can cause RAM to deteriorate and the system to fail. You should purchase a

fan to cool the system. If this step doesn't solve the problem, read on . . .

Another reason for sporadic problems is oxide buildup on the interface card and/or chips. After many hours of use, the edge connectors on your interface cards and the pin tips of the computer chips can oxidize. The oxide buildup prevents computer signals from being correctly transmitted. If your system also is overheated, you'll have nonrepeatable problems. To solve your problem, try cleaning the card's edge connectors, reseating the chips by gently pushing them into their sockets, and installing a fan to cool down your system. Since you'll be dealing with the innards of your Apple, you may want to have a qualified repair person do the cleaning and reseating. If you're careful, you can do it yourself, though.

First, turn off your system, but don't unplug it. Remove the top of the case according to the instructions in your owners' manuals. Touch the power supply to ground yourself. Static can kill a chip, so be especially careful not to skip this step. Your system is plugged into a three-pronged, grounded outlet, isn't it? If your system is normally in a room with a rug, you may want to move it into a room with a wood or tile floor. (Plug it back into a grounded outlet if you do.)

To clean the edge connectors, you'll need rubbing alcohol, a lint-free swab or cloth, and a pink eraser. Remove an interface card from one of the slots—hold it by the edges to lessen the possibility of damage. Gently rub the eraser over the gold-covered connectors that fit into the slot. Repeat this process for all the cards, including the card in the auxiliary slot, if you have a IIe.

To reseat the chips, be sure you are grounded; then gently press on each of the socketed chips on the main Apple circuit board. Don't press hard, or you'll risk bending the circuit board and breaking a circuit. The idea is to slightly dislodge the chip and shake loose any oxide buildup.

If the problem persists even with the fan and after the cleaning, run—don't walk—to your dealer for a thorough checkup. If the problem reappears after minimal use, say a month or two, get thee to a dealer: You do have a system problem. You shouldn't need to clean the connectors or reseat the chips more than once every two years or so. ✚

APPLE®, ATARI® and TRS-80® OWNERS!

Three fantastic books from *Creative Computing Press*...

THE CREATIVE APPLE

The best articles and features on the Apple to appear in the past four years of *Creative Computing* are gathered together in this interesting and entertaining book. Revised and updated to include the latest information, this wealth of material gives you dozens of ways to tap the tremendous potential of your Apple. Contents range from graphics, music and educational applications to word processing, software reviews, games and tips on easier programming. Whatever you use your Apple for, you'll find plenty here to help you get more out of it than you ever imagined possible.

The Creative Apple, edited by Mark Pelczarski and Joe Tate. 8½" x 11", softcover, illustrated. $16.95.

THE CREATIVE ATARI

Whether you're an Atari beginner or seasoned expert, you really shouldn't be without this extraordinarily useful guide to practical Atari "how to" and lore. You get tutorials on Atari graphics, a discussion of Atari memory concepts, programming tips, programs and much more that will help you make better use of your Atari. It's written so the average, non-expert user who knows a little about BASIC and simple programming can easily develop into a skilled Atari user. The contents have appeared as articles, columns and tutorials in *Creative Computing,* but have been thoroughly revised and updated to insure maximum learning ease.

The Creative Atari, edited by David Small, Sandy Small and George Blank. 8½" x 11", softcover, illustrated. $15.95.

THE CREATIVE TRS-80

Here's a complete guide to everything you can do with your TRS-80 and how to do it better, faster and more expertly: games, graphics, educational applications, business applications, programming aids, music and a review of handy hardware and peripherals. Whether you're interested in expense management or educational techniques, symphonies or color composition, this valuable volume will enable you to use your TRS-80 for more exciting and satisfying computing almost immediately.

The Creative TRS-80, edited by Ken Mazur. 8½" x 11, softcover, illustrated. $15.95.

Registered Trademarks: Apple: Apple Computer, Inc.; Atari: Atari, Inc.; TRS-80: Radio Shack division of Tandy Corp.

CONVERSE WITH YOUR COMPUTER

AT LAST! A FULL IMPLEMENTATION of the original ELIZA program is now available to run on your Apple II.

Created at MIT in 1966, ELIZA has become the world's most celebrated artificial intelligence demonstration program. ELIZA is a non-directive psychotherapist who analyzes each statement as you type it in and then responds with her own comment or question—and her remarks are often amazingly appropriate!

Designed to run on a large mainframe, ELIZA has never before been available to personal computer users except in greatly stripped down versions lacking the sophistication which made the original program so fascinating.

Now, our new Apple II version possessing the **FULL** power and range of expression of the original is being offered at the introductory price of only $25. And if you want to find out how she does it (or teach her to do more) we will include the complete **SOURCE PROGRAM** for only $20 additional.

Order your copy of ELIZA today and you'll never again wonder how to respond when you hear someone say, "Okay, let's see what this computer of yours can actually do!"

ELIZA IS AVAILABLE IN THE FOLLOWING VERSIONS:

1. Protected Version $25
   (Protected Version can be run but not listed or modified)
2. Un-protected Applesoft BASIC Source Version $45
   (Source Version can be listed and modified as well as run)

Both versions include a six page user manual and will run on Apple II, Apple II+, Apple IIe and Apple IIc.

Please add $2.00 shipping and handling to all orders (California residents please add 6½% sales tax)

WRITE YOUR OWN APPLE GAMES

Includes 40 exciting pre-programmed games to get you started!

Write Your Own Apple Games is your ticket to thousands of hours of solid game fun.

But it's more than just a game book.

While you're enjoying more than 40 exciting new programs, you'll be learning—quickly and easily—the most advanced techniques of computer game design.

In ***Write Your Own Apple Games,*** Stuart Anstis explains each game to you in logical, step-by-step subroutines. You'll see crucial game graphics exactly as they should appear on your screen.

Then you'll learn how to rearrange the basic subroutines to create countless game variations.

If you know BASIC, you're ready to learn state-of-the-art game techniques, including how to:

- Create smooth, flicker-free screen movement
- Generate flashing "neon-sign" graphics
- Keep game scores
- Use random number in game design—and make your computer come alive as an opponent
- Zero in on random time delays—a challenge to even the most sophisticated arcade player

And much more.

Write Your Own Apple Games gives you all the skills you need to start designing your own original computer games for fun—and profit!

And because writing your own games gives you greater control of your Apple's numerical and graphic capabilities, you'll be opening the door to fantastic new possibilities for using your computer.

Write Your Own Apple Games should sell for over $1,000—the cost of 40 prepackaged games.

Just a Few Reasons We're Number One.

When you're figuring which tax software investment will give you the greatest return, consider this. More people buy HowardSoft's Tax Preparer for their IBM-PC, TI Pro, or Apple Computer than any other tax package around. Now, if that's not reason enough to choose HowardSoft for yourself, here are just a few more.

It's easy.
HowardSoft's clear instructions walk you through the program and simply detail the most-used forms and schedules.

It's accurate.
With your tax form right on the screen, you enter information just once. Tax Preparer calculates quickly and accurately, makes changes automatically, and even re-checks for consistency throughout your return. It delivers IRS-accepted printouts, error-free and ready to mail.

It works hard.
Tax Preparer keeps your on-going records completely accessible, in perfect order and ready for projections all year-round.

It's reasonable.
HowardSoft's years of experience with tax related software really pay off. You get the features of high priced packages at a fraction of the cost. Plus inexpensive updates for easy filing year after year.

It's unique.
No other software does so much. Tax Preparer provides 21 separate IRS forms and schedules. It gives you unlimited itemizing, word-processor-type editing, and help messages at the touch of a key. And it even has a built-in tax planner for projecting the future.
You can call or write for even more details than these. When you have all the facts it all adds up. There really is no reason to buy any other tax package than Tax Preparer by HowardSoft.

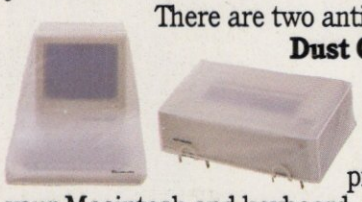
Maccessories™ make a good thing even better.

The Macintosh™ is easy to use. Maccessories from Kensington Microware make it easier.

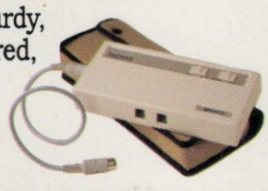
First in the Maccessories family of enhancement products is the **Swivel.** A slim swivel base that attaches underneath the Macintosh, making it easier to reposition the computer. It goes everywhere the Macintosh goes, even inside the carrying case.

The **Surge Suppressor** is a replacement power cord, providing UL listed surge suppression and line noise filtering for the Macintosh. It fits easily into the carrying case, so your Macintosh is protected no matter where you take it.

There are two anti-static **Dust Covers** in the family. One protects your Macintosh and keyboard. The other takes care of your Imagewriter.

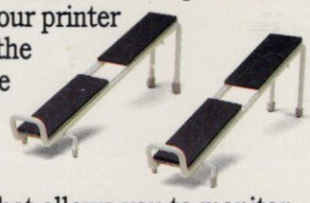


Leave your delicate, intelligent modem at home. The **Portable Modem** is the perfect traveling companion for the Macintosh. It's small, sturdy, battery powered, weighs less than a pound and even has its own carrying case. The Portable Modem operates at 300 baud with any communications software.



The **Control Center,** styled to fit underneath the external disk drive, provides fingertip control over your whole system. There's a master switch to power the whole system on and off, and separate switches for a printer, modem and one auxiliary device. It also protects your whole system from power surges, line noise and static shocks.

The **Universal Printer Stand,** for the Apple® Imagewriter,™ also fits most other dot matrix printers. It raises your printer 1½" from the desk at the front and 4½" at the back, an angle that allows you to monitor your printer's performance more easily. By raising your printer a few inches from the desk, the Universal Printer Stand solves the problem of where to store your paper. Several hundred sheets are accommodated neatly underneath.



The **Disk Case** provides safe storage for 36 Macintosh disks. And it comes with a handy packet of spare disk labels.

There is more to Maccessories than hardware.

Maccessories Professional Type Fonts are styled after the most popular type faces in the advertising and publishing industries, like Times Roman™ and Helvetica.™ They give reports a professional look and add a touch of elegance to correspondence. Available in two volumes. Professional Type Fonts For Text contains 16 unique fonts in sizes 12 to 24 point. For Headlines (for the 512K Mac) contains the same fonts in sizes 24 to 72 point.

Maccessories Graphic Accents is a collection of over 250 professional illustrations, covering everything from business to holidays. Use them for reports, newsletters or greeting cards. Graphic Accents are stored in standard MacPaint™ files, so you can adjust them, copy, cut and paste them just like your own illustrations.

Available at Apple dealers everywhere.
